Citrus Market

New York Market.

NEW YORK. Feb. 19,—There has been a big improvement in conditions during the past week in the Middle West, and oranges are selling fully 25 cents per box higher. As an illustration, cars standing on the the tracks at Chicago last week drew offers of $2.50, with a discount for large sizes, and this week the same cars have been sold at $2.75 straight. Inquiry is stronger than it has been at any time this season, with considerable f. o. b. selling at $1.65 to $1.85 for extra choice. The country is beginning to wake up. Many small interior towns that have been doing nothing for the past six weeks are asking for oranges at the present time.

There should be a good advance again next week. The auctions still show low prices, owing to the fact that there are a good many cars of undesirable stock and off sizes that are cleaning up in those markets, and there is no question but conditions will materially improve. Oranges are holding up splendidly, with very little sign of puff; there is no dropping whatever, and everything is very encouraging.

In New York city and the Atlantic coast the extreme cold weather is depressing the market, and until such time as the weather is more favorable no material improvement can be looked for. Sizes 176s and smaller are in very light receipt and are generally selling to good advantage, but 64s to 126s are too plentiful, and this, together with the zero weather, has had a depressing effect. Fruit stand and push cart peddlers cannot operate favorably under conditions at present existing.

Just at the present time apples, cheap apples have been looming up as a rival to the orange. It has been customary for the Eastern buyer to bring out the bogy of cheap apples to bear the price of oranges. The bogy did not scare the orange men this year and they have held stiffly to what they thought was the price they should get for their product and now we learn that good apples are scarce and that prices are going up.

Florida appears to be down and out, as orders are coming in for Californias from other districts that handle Floridas altogether when they can get them. A healthy sign is the increasing number of cash orders, one dealer purchasing 35 cars during the past ten days.

There has been an eager demand for first-class California lemons for the past ten days. Prices are the highest for any February in the history of the business. There is already an active inquiry as to the possibility of supply future orders, and if the California lemon shipper could only assure the eastern dealer that his market would be supplied regularly he would need have no further feats of competition in that market from outside sources.

At a foreign lemon sale in New York City Friday of this week, 16,000 boxes were sold at prices ranging from $2.40 to $3.00. The sale was spirited and the buying was mostly for out-of-town accounts. A decided preference was shown for 300s. On the same day California lemons sold at from 25 cents to 50 cents per box higher. The f. o. b. prices for our lemons range from $2.00 to $2.65.

There is much in the present situation to encourage the grower and shipper of citrus fruits. The situation has been tense for some time, but the interested ones have held for fair prices and thought there has been much suspicion everywhere that the break would come, and many other causes to worry them, they are now in a position where they can breathe easier and view the future with more confidence. Shipments are not more than the markets can stand, old fruit is out of the way, the worst of the winter cold is practically over. Floridas are out of it, and orders are coming in. Educate the people to want large sizes and prod the railroads into activity, and the best season ever is assured.

The market today (19th) is very active and steadily advancing. Erie Railroad could not deliver several of the cars catalogued for today's sale. Weather cloudy and threatening. Sixteen cars oranges and three cars lemons sold today.

LOS ANGELES, Feb, 19.—Shipments for February 18 were: 98 carloads of oranges, 11 carloads of lemons.

Total to date this season, 6657 cars of which 825 cars are lemons.

Total to same date last season, 7913 cars of which 956 were lemons.

Fit a Round Peg in a Round Hole

Yes we meant every word that we said last week about the failure in poultry is largely at the start. First get good eggs from well nourished, properly fed hens. Then feed your young chicks on A. C. W. Chick Food and you will succeed in raising fine strong birds. No one would feed an infant 6 weeks old soda crackers or second-hand bread crusts. Don't feed your infant chicks improper food either. A. C. W. is made specially for infant chicks and infant digestions.

Agricultural Chemical Works

901-907 Macy St. - - Los Angeles, Cal.

Manufacturers of A. C. W. Egg and Chick Food and all raw materials, Blood, Meat Meal, Beef Scraps, etc.

Excelsior Mills

Excelsior Chick Food

Excelsior chick food is a perfectly balanced ration for your growing chicks. Will raise the largest possible per cent. of your baby chicks. All pure food, no shriveled grain and filler used in its manufacture. Absolutely clean and free from dust. No waste.

The Best Food on the Market

Ask for Excelsior. If your dealer cannot supply you write us. Circular free if you mention the Cultivator.

Sugar Gum

Better Than an Orange Grove

For quick returns, a few acres in Gum Trees will grow into actual dollars with a bigger percentage of profit than any deciduous-fruit-producing trees. We have a small quantity of seeds of the new variety Sugar Gum—Eucalyptus Corynocalyx—taken from extra fine specimens of trees grown near Claremont, Los Angeles County. This variety is highly ornamental, rapid growing—and of high commercial value—its timber being very durable both above and under ground.

Irrigation and Pumping

WATERS OF THE SAN JOAQUIN.

IN THE investigation of the underground waters of the San Joaquin Valley which the United States Geological Survey has been pushing vigorously during the last season many perplexing problems are arising to the solution of which the geologist in charge of the work is devoting much energy.

Minor geological structures about the borders of the valley, buried saline deposits which seriously affect the quality of the waters, changes in ground water level resulting from over-irrigation and the consequent deterioration of lands through the accumulation of alkalies at the surface are questions which, with many others, are being studied in order that the final report on the work may have the greatest practical value to present and prospective settlers.

Conditions near the northern and at the west side of the valley are particularly unsatisfactory from the water users' point of view. West side ground waters are generally poor in quality and beneath the more valuable lands they lie at considerable depth. Two possible remedies have been suggested—one is the development of ground waters at a point pretty well south in the valley where good waters may be obtained as artisian flows, or as ground waters that may be pumped with comparatively small lift, the waters thus developed to be delivered to a canal and carried to some of the lands in the vicinity of Crow's Landing or further north, which are at present without gravity waters.

The other way contemplates the lifting of water from the San Joaquin by some effective pumping device and delivering it by a similar canal. Conditions along the east slope of the valley intermediate between its axis and its eastern edge emphasize the need of light on alkali problem in the valley. In this area alkalies are rising as the result of irrigation and lands originally valuable are becoming useless. Plans are now being made for a thorough investigation of these conditions.

Philanthropist—"But why don't you get a hand-organ and go round and try and earn some money?"

Tramp—"No, that would be too much of a grind."

When writing advertisers mention Cultivator

RECLAMATION OF ARID LANDS.

In a letter to the National Irrigation Congress, which met in Boise, Idaho recently, President Roosevelt summarised the work that has been undertaken under the Reclamation Act passed about four years ago. The President wrote:

"Already the government has made a thorough survey of 10,000 square miles of desert land, and plans have been adopted for placing nearly one-sixth of it (1,000,000 acres) under irrigation. At present 200,000 acres are provided with ditches and not less than 10,000 men are employed in the twenty-three large enterprises which have been begun. The amount of money which has thus far been devoted to the work is $40,000,000. As most of the readers of "The Farmer" will remember, this is not taken from the taxpayers' pockets by Congressional appropriation, but is derived from the sale of public lands. Eventually, the government expects it will be recovered from similar sales in the different regions that are benefited by the improvement, and will be used over and over again for the same beneficent service."

One of the most perplexing questions which the administration is trying to solve is how to secure the advantages of irrigation to the largest number of settlers in a given area. In Mr. Roosevelt's opinion a farm of 160 acres is much too large for the average tiller of the soil. He does not believe that any one can do justice to more than forty acres, and in some localities, in his jubgment, five would be a liberal allowance. Only a moment's figuring shows that a million acres would funish only 6,250 farms, each embracing a "quarter section," whereas if the average size were not greater than twenty acres, fully 50,000 farms would be available. Manifestly, the man who, with a secret purpose of speculating in land, applies for 100 acres, discourages settlement by others near him and interferes with the development and prosperity of the country, but it is far from easy to discourage such persons. It would be a boon to the states in which this work is in progress and to the individual settlers if a way could be found to convince the latter that a small farm would be more useful to him than a big one.

Making a perceptible addition to the arable area of the United States is, of course, a service to agriculture, though the labor is performed under the direction of the geological survey, and hence under the auspices of the Interior Department. The sum which is devoted to this improvement may seem large in comparison with that which is spent in the interest of commerce on rivers and harbors—less than $20,000,000 a year on the average for the last three years. Reclaiming arid land, however, is much the cheaper, because the government merely lends the money which is used for that purpose, whereas the appropriations for river and harbor improvements are permanently invested.

Scott—Many a man who sees a mote in his neighbor's eye has a beam in his own.

Mott—That's natural. It makes a man's whole face beam to discover something wrong about his neighbor.

Pomona, California

The desert is disappearing; the Oregon trail is gone. Above them are fields of golden grain and railroads traverse the fertile stretches. Ask a settler for the story and he can tell it in few words. Idaho is the child of irrigation.

In no other section of the barren West is the progress of reclamation more effectively illustrated than in this state. At the recent gathering of the delegates to the National Irrigation congress in Boise the development of the reclamation service was presented in detail. It was shown that in 1870 there were 414 farms in the newly settled territory of Idaho. That by means of crude irrigation the aggregate number of farms in 1900 had increased to more than 17,000. Today in this state are anproximately 1,353,000 acres of irrigated lands under cultivation, with a total of over 4,000,000 acres under irrigation canals awaiting the settler.

These lands produce wonderful crops. The results of irrigation are emphasized near Boise. A highway skirts the foothills west of the town. To the right of this highway are slopes of arid waste lands on which grow nothing except the dull and gray sage brush of the desert. To the left are fruit orchards, fields of clover and alfalfa, berry patches and pastures lined with sunflowers. The peaches from these orchards are very large. The most choice are shipped to New York where they are served in the high-priced cafes at twenty-five and thirty cents each. The prunes are as large and well flavored as those in California.

The desert lands of Idaho are being reclaimed by means of three agencies: By association of land owners; by the state under the provisions of what is known as the "Carey act," and under the provisions of the reclamation law enacted by Congress in 1902. All of these plans have the same end in view, the ownership by the land owners of the canal systems from which they take water. Through private enterpises projects for the reclamation of nearly 800,000 acres have been completed. Under the Carey act nearly one-half million acres are in process of reclamation.

The government projects now under construction will reclaim about 1,100,000 out of a total area of about two and a half million acres, which will be irrigated and made producing lands within the next few years. With the exception of about 1,800 square miles in the extreme southeastern corner of Idaho all the lands in this state are embraced in the Columbia river drainage, of which 84,000 square miles—the valley of the Snake river—is included in Idaho. The normal flow of the Snake river and its tributaries is practically appreciated by the calans now in operation and those under construction. The plans of the government provides for storage reservoirs in the head waters where the flood will be conserved and utilized during the seasons of minimum flow.

NATIONAL IRRIGATION CONGRESS.

It is announced by the officials of the National Irrigation Congress and of the California State Fair, that the dates of these two events have been fixed to cover the first two weeks of September, and that an Inter-state Exposition of irrigated-lands products on a large scale will be held, commencing with the opening of the Irrigation Congress on Monday, September 2d, and continuing until the close of the State Fair, Saturday, September 14th.

This will have the effect of making the California State Fair an Interstate Fair, so far as agricultural products are concerned, and it is altogether probable that the live stock feature, too, will be made to include all the Western States. "The California State Fair, Inter-state Irrigated-lands' Products Exposition and Western Stock Show," is the name that has been suggested for the big event, which will eclipse any similar effort ever made in this State, with the single exception of the Midwinter Fair, held in San Francisco several years ago.

Under the plans tentatively agreed upon, the details of the Interstate Exposition will be handled by the Sate Agricultural Society. The Board of Control of the Irrigation Congress will, of course, take an active interest in it, and will offer handsome prizes for Intersate exhibitors, in addition to those offered by the State Agricultural Society. A number of cups and other trophies well worthy of interstate competition will be among the prizes offered, and it is expected that competition for these will be open to all other States, but not to California, as a second set of trophies and prizes will be offered for Sate Fair exhibitors. In the Interstate Exposition this State will act as host to visting States and visiting exhibitors of irrigated-land products, and will hang up prizes for which her guests will compete.

The proposed exposition has been fully discussed between the members of the Board of Control of the Irrigation Congress and Mr. J. A. Filcher, Secretary of the State Agricultural Society, and the plans are practically detremined, subject to the approval of the Directors of the State Agricultural Society at the next regular meeting, to be held in this city February 24th.

Details for the big event are still to be betermined, but it is probable that the Interstate Dry Lands Exposition will open Monday, September 2d, and that an effort will be made to have the agricultural and horticultural exhibits of the California State Fair in place also by that time. The Irrigation Congress will be scheduled to meet on the 2nd, but the proceedings of the session will probably be deferred until Tuesday the 3rd. Saturday, the closing day of the Irrigation Congress and the opening day of the State Fair will be marked by some kind of a grand demonstration, including a parade that will eclipse any previous affair of the kind.

The Board of Control of the Fifteenth National Irrigation Congress will undertake to expend $50,000 providing for and entertianing the Congress. Two weeks of enjoyment will be provided, and visitors will be given the time of their lives. The days of the session will be quiet, in order that the attention of the delegates may not be distracted from the main purpose of the Congress, but other days will be full of live program. Anticipating a desire on the part of visitors from other States to see as much as possible of California, a series of excursions will be arranged for their benefit. These will be run through the Sacramento and San Joaquin Valleys, and possibly as far as the Klamath project on the north, the Truckee-Carson project on the east and the Yuma project on the south.

"MACBETH" is the sterling mark for lamp-chimneys.

You can't get a poor lamp chimney with my name on it.

MACBETH lamp-chimneys fit, don't break from heat, and are so shaped that they get the most light from the oil consumed.

All lamp-chimneys break. Mine break only when they are dropped or knocked over.

GREAT LAND OPENING IN CALIFORNIA

We are opening the Western side of the Sacramento Valley under irrigation for the first time. PRESIDENT ROOSEVELT has signed a Special Act of Congress granting our great Central Canal 45,000 miner's inches of water from the navigable Sacramento river, enough to irrigate 200,000 acres. Rich, black sediment soil; free water right, best in U. S.; climate unexcelled; all fruits and vegetables grow to perfection; rail and steamboat transportation to ready markets. 10, 20, and 40 acre tracts from $30 to $100 per acre—terms, one-sixth cash, the balance in five years. Excursion rates from all Eastern points after March 1st. Rates from Los Angeles now in effect. For information and literature write or call on F. E. ROBINSON & CO., 216 Pacific Electric Building, Los Angeles, Cal.

BURN AIR AND SAVE FUEL

You can do it with the
HAGUE IMPROVED DOMESTIC OIL BURNER.

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to

Hague Domestic Oil Burner Co.,
214 Winston St., Los Angeles, Cal.

THE TRUE AMERICAN.

He need not first behold the day
  In Georgia or in Maine,
Amoung New England's snowy hills
  Or Dixie's sugar cane,
To be the noblest of his kind
  Since first the world began,
The best beloved of freedom's sons—
  A true American.

The Norseman with his viking blood
  And locks of yellow gold,
The German feeling in his breast
  A knightly courage bold,
The lad of England's dewy lanes
  Or Scotland's ancient clan,
Each rallies to the stars and stripes—
  A true American.

It matters not the spot of earth
  That claimed him at his birth;
The open hand, the royal heart,
  The soul of honest worth,
The love of right and liberty,
  The life that all may scan—
These are signs by which we know
  The true American.

—MINNA IRVING.

A MARINE WANDERING JEW.

SINCE steam has largely taken the place of sail on the ocean I doubt if the sailor's yarn is what it was fifty years ago when the Black Ball line of clipper ships sped between the occident and the orient. In my younger days—I was but a lad—I sailed before the mast in the Breadnaught. Among our crew was Seth Hawkins, an old salt of forty. We considered him a Methuselah, a tall, thin man with a profusion of little red curls.. He was very religious, observing all the commandments scrupulously except the ninth, "Thou shalt not bear false witness," and in this he sinned only in spinning yarns, which he always vowed were real happenings. One starlight night on the forecastle while we were lounging about the capstan be gave us the following:

"You've all heard a lot about Judas Iscariot, who was cursed with havin' to live forever and wanderin' all over the world, at one time bein' seen in Egypt, another in France, and so on, always leavin' a trail of misfortune in his wake. But I don't believe any of you has ever hearn about his sailin' the seas. There's no sense in this, for how could he have got to Ameica where he's turned up often, unless he crossed an ocean? Leastways I've seen him myself, and on the water too.

"I first shipped on the Mark Matthews on a voyage around the Horn to take in hides on the west coast of South America. We was layin' in the doldrums one evening just before four bells. A thick fog was all about us, and we couldn't see a cable length. All of a suddent I heered a bell. It struck four times. As soon as it stopped our bell struck too. Then the fog thinned a little, and just about half the ship's length from us was the oddest lookin' craft I ever clapped eyes on. She was awful high in the poop, low in the waist and had a head on her bow like that of a sea sarpent. She had two masts like a schooner, and the sails was hung on 'em like they put 'em on Chinese junks. Of course they hung limp like ourn.

"She was head-on, and the fog didn't let us see abaft the fo'mast. On the forecastle stood the figur' of an old man I couldn' tell you how old he looked, but there was somethin' about him that reminded me of a people long passed away. He was a Jew and the Jewiest lookin' Jew I ever see. He was wrapped in a cloak that looked like a monk's frock. The melancholy way he stared out o' them blinkers o' his'n was enough to send a cur yelpin' to his kennel. They was like the eyes of a sick man as hadn't slept durin' a thousand year voyage. There wasn't a bit o' color in his cheeks unless you call the leathery look o' the hides we've got below color, and it seemed as if I could see right through his gastly lips to the few teeth that was left in his jaws. He hadn't any hat on, and I wasn't near enough to see just what his hair was like, except that he had mighty little. But somethin' was a-movin' on his skull that looked like worms. Whether it was worms or hair I couldn't see, it must a' been worms, for there wasn't the ghost of a breeze to move even the finest hairs. He stood there lookin' at us without any interest in them melancholy eyes o' his'n, and the only motion he made was with his skinny hands, pourin' some silver coins from one hand to t'other. Every oncet in awhile he'd make as if to throw the silver away, but he couldn't, and every time he tried and failed his face would take on an expression of awful remorse.

"While I was lookin' at him the two ships was so slowly driftin' apart that nobody could see 'em move. The other craft was gettin' in our stern. The Jew's blinkers was movin' about, never restin' on anything for mor'n half a second till suddenly they struck our stern. Then there was the worst fright come into 'em I ever see on any man's face, not even a mutineer I once saw hung when he caught sight o' the noose danglin' from thet yardarm.

. "What did he see? Didn't I tell you our ship was the Mark Matthews? The name o' course, was on the stern. Some o' the letters was faded, and the 's' in Matthews was pretty nigh gone, What the Jew saw was the names o' two o' the apostles, Mark and Matthew.

"Then for the first time it struck me who it was. He was the wanderin' Jew. As soon as he saw the names o' them two old friends o' his'n he was throwed on his beam ends. You see he was one o' the twelve in good and regular standin' till he betrayed his master for them thirty pieces o' silver. To be brought face to face with two of the disciples after a couple o' thousand years' wanderin' must 'a' brought back unpleasant remembrances.

"By this time I felt so bad for the poor old sinner that I wanted to give him somethin' to warm him up. I ran below, got some grog in a can and ran back, expectin' to swing it over to the Jew at the end of a rope. But when I got on deck the strange lookin' craft had disappeared in the fog.

"But where she'd drifted to was a puzzler, for within ten minutes the fog lifted, we could sweep the horizon, and there wasn't a sail to be seen.

"Within an hour it come on to blow out o' the sow'west. That was the gale when I was wrecked, the Mark Matthews goin' to the bottom and the crew bein' picked up half dead by a whaler."

E. A. MITCHEL.

"My dear," said the caller, with a winning smile, "I suppose you assist your papa by entertaining the bores?"

"Yes, sir," replied the little girl gravely. "Please be seated."

A MENTAL HOUSECLEANING.

The first of the year is considered by the people of commerce a time for taking stock and making a clearance of a lot of odds and ends that have accumulated since the preceding January. New goods take the place of old ones, and everything useless is weeded out and disposed of to make room for spring custom. The "survival of the fittest" is the law in vogue.

This season is followed by a protracted session of housecleaning, the turning of rooms inside out that no speck of dust may sully the fair walls of our habitations. Rubbish is burned, places found for unclassified possessions, and when all is done we look with becoming pride and satisfaction on the result. A little temporary inconvenience, and the family can settle down in comfort in that cleanliness which is "akin to godliness."

But we seldom think of that mental taking stock and housecleaning which is more specifically necessary to our well being; the clearing out of the hoarded rubbish of years— prejudice, hate, envy, and a host of other evils that we do occasionally whitewash but never dislodge. We set a high value on order in the household; each picture must occupy its own place on the walls, each chair is at its proper angle, but the temple within, the house beautiful, is left to dust and disorder. The pictures are not hung, but stacked in corners where the cobwebs of memory cover them. Take them out this new year and bursh off the film of neglect. The furniture needs replenishing. Look at it. Oh, what medley of old loves, old hates, forgotten resolutions, neglected duties, rankling grudges, and the atmosphere that such unholy furnishings provide!

Let us rehabilitate our mental house, replace hatred with divine forgiveness, estrangements with reconciliation. Make a place for visiting angels, and no longer need the apology that we have been too busy with the house of wood to attend to the house of the soul.—[Rural Magazine.

WOMEN'S CLUBS.

The following is an extract from an article by Kate Upson Clark, which is of interest to women who wish to make the most of life for themselves, family, and friends:

"The clubwoman has learned that the care of her home is not the end and objcet of her existence; that a house is merely the chief tool in the making of a home. In order to give the highest atmosphere to her home, she must make herself as bright and beautiful and interesting and rational as possible. She must go abroad and meet her friends, those who are in circumstances similar to her own, and sharpen her wits upon theirs. She can do her full duty to her home, not by sinking entirely her own personality, but by strengthening and ennobling that personality, so that she may better impress her own lofty ideas upon her growing family. Thus can she make her home the joy and delight to her husband and children that it ought to be. The studies and addresses enjoyed by the average club tend to broaden their minds and to teach them to measure 'small things small and large things large.' Thus is developed the important sense of proportion and comparison, a faculty most needed in the home.

"The actual range of ways and means of household and family management has been greatly increased by club researches. Women in their clubs have come, not only to know better fellow-women, but to love them better. There has been developed a wonderful comradeship, such as has never been seen before. This has extended to men. As the interests of women have gone out to education, art, and science, they have met men on a dieffrent footing. Sex has been more forgotten in the realization of a noble companionship and mutual helpfulness in furthering the great common objects of humanity. The clubs have been the great idealmakers for our women. Amid all the snobbishness, the shallowness, and the blunders of these clubs, the ideals have been, on the whole, the highest and best. The ideal is the most important element in every life, especially the ideal of the home. There is nothing like getting together and comparing notes. The idea that there is only one way in which to perform household duties and family duties, and that women know this by instinct, is far from the truth. The conduct of a home, with its various departments, is fully as complicated as any other business enterprise, perhaps more complicated than any business. There is a best way of doing washing, ironing, cooking, cleaning, child-rearing, purchasing, entertaining. In the woman's club every possible phase of these subjects has been discussed to the betterment of all.

"A woman may love her children and husband to distraction, but if she has only their society from week's end to week's end, she is likely to become one of those patient, self-effacing drudges and ciphers who were the saints of a former generation. They were good, their self-abnegation was heavenly; but they were not interesting. Too often they became to their children, as they grew older, mere objects of tender compassion. 'Poor mother,' as they might have said poor Lightfoot or poor Ponto. The woman who has learned her profession in the club wants no pity from her children. She is their comrade, for she is learning how to keep her health and youth and control her nerves, and can discuss with them their studies, and help them. A powerful instrument of education, especially for the middle-aged woman, is her club."

The World's Largest Cactus

Denizens of the Desert Whose Gigantic Forms Stand Like Grim Sentinels Watching O'er the Pathless Plains

IN its native habitat of Arizona and Northern Mexico grows the largest-growing member of the cactus family, cereus, attaining a height of sixty feet and a diameter of two or more feet. In the United States it is usually known simply as the "Giant Cactus." In Mexico they call it the "Sawuarro." In proportion to their size these Giant Cacti are among the heaviest plants known, the body being composed largely of water.

So full are they that travelers nearly perishing of thirst have saved themselves by cutting out a large piece and shaping the bottom of the wound like a basin to catch the water or sap, which collects in a considerable quantity in an incredibly short time. One would scarcely seek to quench his thirst in this manner except in cases of dire necessity for the sap is not of a pleasant taste.

The flowers, usually white or tinged with blue, are borne in a circle of clusters near the top of the plant, giving the effect of its being crowned with a wreath of white. These blossoms are followed by red edible fruits quite like a fig or pear in shape.

The native Indians make it a point to gather these fruits for food and manufacture from them an intoxicating beverage. To obtain these fruits the Indians push them off one at a time, using a long pole, which is sometimes obtained from a dead trunk of one of these giants, for when dry the body splits up into thin strips the extreme length of the plant. The flower of the Giant Cactus has been adopted by Arizona as the territorial emblem, and when the territory becomes a state, will doubtless still be found on their coat-of-arms.

Coulson's Mixed Foods

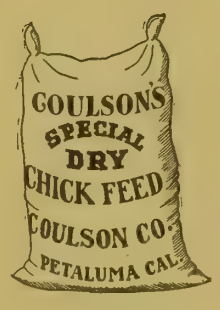
Must Be Used

From The Start

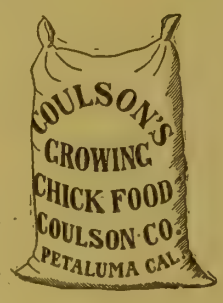
Waiting for meal of Special Dry Chick Food

If you want to get plenty of eggs in winter, you must start your plans by raising lots of chicks in the Spring.

Raise them on



Coulson's Special Dry Chick Food



for the first six weeks or so, till they are well feathered, strong and active. Then keep up their continuous and rapid growth by feeding

Coulson's Growing Chick Food

This will keep you free from the many losses resulting from improper feeding of the chicks, will bring them rapidly to maturity and will insure you a quantity of eggs in the following winter when prices are high.

Superiority of Coulson's Special Dry Chick Food

The California Tussock Moth

An Orchard Pest for Which Hand Picking Seems to be the Only Effective Means of Extermination

By W. H. VOLCK, Entomologist for Santa Cruz and Monterey Counties

PROF. WOODWORTH says:—"It has often been remarked that when an insect like the codling-moth produces considerable injury, orchardists are very prone to class all manner of injury to this fruit to this one cause. The injury done to apples and apple trees by the tussock-moth hardly resembles the work of the codling-moth in any particular, still it is very commonly so classed. The present study is the first extended account of the economics of our Western tussock-moth. This insect, which is the only representative of its family in California, differs from other caterpillars, including its nearest Eastern allies, in its remarkable tolerance of arsenical poisons."

Preliminary Studies.

The tussock-moth caterpillar affecting apple trees in the Pajaro valley was brought prominently to the attention of the Experiment Station during the first season of the codling-moth investigation in the spring and summer of 1903, and considerable attention was given to it, including certain experiments by Prof. W. T. Clarke, who was then in immediate charge of the investigation in this valley.

It was then noted that the Paris green spraying, as conducted for the control of the codling-moth, did not destroy these larvae. Prof. Clarke found that caterpillars of this species inclosed in a cage with thoroughly sprayed leaves were able to develop, going through their normal transformation to full maturity, and finally laying eggs in an apparently normal manner.

In the spring of 1904, Mr. C. H. Rodgers, the Horticultural Commissioner of Santa Cruz county, sprayed trees, using the Kedzie formula as given in Bulletin No. 155 of this Station, as a special experiment to aid us in determining its efficiency as a control for the tussock-moth. The spraying was done in a most thorough manner and frequent observations were made, as in the previous year. Some of the caterpillars were inclosed in a jar and fed on thoroughly sprayed leaves only. Neither the insects on the trees nor those inclosed in the jar seemed to be materially affected by the poison and succeeded in developing into the adult moths.

Hand Picking.

During that season the insects prospered rather better than usual and it was noted that an unusually large number of egg masses had been deposited on the trees in many of the orchards. Noting this condition and because of the failure of the spraying experiments, Mr. Rodgers advised the orchardists to rely on the older "hand-picking" method—gathering the egg masses as thoroughly as possible during the winter and destroying them.

Mr. Rodgers and one or two orchardists carried out this program, collecting large quantities of the eggs. As had been anticipated, the tussock-caterpillars became a serious pest in 1905 and wrought thousands of dollars' damages to the apple crop; but where the egg masses had been very carefully picked off the injury was not excessive, although rather too severe to be viewed with equanimity.

The serious injury wrought in orchards where the eggs had not been picked off led many more of the orchardists to apply this method thoroughly during the winter season of 1905 and 1906.

Extent of the Work.

In all there were at least fifty orchardists who went over the trees at least once, and several picked them off two or three times. Others were content to instruct the pruners to remove such of the egg masses as they could discover. In the latter part of May, 1906, we had several hundred apples of the Bellflower and Newtown Pippin varieties picked off indiscriminately in orchards where egg picking had been done thoroughly, and also in unpicked orchards near by for a check. These orchards were of course in the badly infested section, and those selected as check orchards were in each case the one most nearly comparable with the other with which it is contrasted.

The average percentage of injured apples in the egg-picked orchards was 23.5 per cent., as against 65.6 per cent. in those unpicked; or a saving, due to picking, of 42 per cent. Where a good crop is obtained, this saving means a considerable profit on the investment required to remove the eggs.

The two orchards of C. H. Rodgers were perhaps the most carefully picked of any in the valley, while adjoining orchards not egg picked lost over 50 per cent. These orchards of Mr. Rodgers average 12 per cent better than those where the picking was less thoroughly done.

Distribution.

The tussock caterpillar is very thoroughly distributed over the Pajaro valley and the adjoining hill sections. It also occurs over the greater portion of California. In the Pajaro valley, while it is to be found everywhere, it varies greatly in abundance, and during the last three seasons its worst ravages were confined to certain definite areas. In 1891 to 1892, according to Mr. A. N. Judd, in a limited area, known as the Blackburn orchard, the trees were defoliated and surrounding places were also badly infested. Something then greatly reduced the numbers of this insect until it was hardly noticed; but in 1903 they again appeared in destructive numbers in the original locality, as well as in several other areas, mostly in the older orchards, and especially near town and toward the beach. These areas are surrounded by a widening circle of less serious infestation. If the increase continues most of the lightly infested areas will be in very bad condition next season, and the general infestation much more evident.

Food Plants.

This caterpillar is commonly found on the live oak and the yellow perennial lupin (Lupinus arboreus) that grows along the beach. In the orchard it feeds on apple and cherry trees, and when very abundant is found feeding on walnut and numerous other plants; but apparently, in such cases, these insects have wandered from their original food plant.

On the lupins at the beach the egg masses do not hatch as early as in the orchards; in fact, the larvae are often abundant in this locality in August and September, which would bring some of the hatchings as late as June.

Life History and Habits.

There is one generation of tussock-moth caterpillar a year. The moths which emerge in May, June, and July deposit eggs that do not hatch until the following spring. The caterpillar requires from forty-five to sixty days for its development, varying according to temperature and sex. The females require a longer time to reach the spinning-up stage than the males and are also much larger. The tussock-moth larva molts or changes its skin four times in the course of its development. This makes five larval stages and at the end of the fifth stage the adult larva spins a cocoon, composed of silk and the hairs which cover the body. These cocoons are not very strong, but entirely surround the larva and afford a good degree of protection to the insect during the pupa stage. Shortly after spinning the cocoon the last larval skin is shed and the pupa stage begins. In from sixteen to twenty-seven days from this molt the adult moth emerges. Fertilization ordinarily takes place at once, and within three or four days the female deposits its eggs.

Habits.

On hatching, the young larvae remain clustered over the egg mass until they have gained their normal nearly black color, which may require two or three days. In the meantime, they appear to be feeding on the material which holds the eggs together. Those larvae which hatch in the interior of the egg mass necessarily have to burrow their way out through this tough binding substance, and the mass eventually appears riddled with these punctures.

This hatching occurs in the orchards about the time the new leaves are expanding; but there is a great variability in the time of hatching, some emerging early in February, while others are still hatching as late as April or even May.

After the larvae leave the egg mass they wander to the near-by buds and commence feeding. This early feeding is in the form of minute punctures in the youngest leaves and blossoms, and the young leaf stems are also attacked. As the larvae grow older they still retain their habit of burrowing into the fleshy tissue, and so do much damage to the young fruit. They become, however, more and more leaf feeders as time advances, and the older insects do little damage to the fruit.

The larvae feed at all times of the day and are not gregarious in habits; those from one nest will become very generally distributed over the tree before the larval life is complete.

The molts are passed in more or less protected places, often on the under side of the leaves. Before molting, the larvae spin a thin carpet of silk on the surface where they expect to remain during the molt. The molt is accomplished by a circular break near the head; the larvae crawl out of the old skins and remove the head shell later.

(Continued on page 220.)

Walnut Trees Come in and let us show you the best trees on the market

Seedlings—1,500, grown from the very best selected nuts, hand picked by Mr. Hamburg from grafted trees—Placentia Perfection and Santa Barbara Soft Shell. These trees will be sold at reduced prices in order to clear the ground. Established in 1887. Home Phone 288.

Deciduous Fruit Culture

By J. W. MILLS

THE CINSAUT GRAPE.

THERE are many broad acres in Southern California that are incapable of being irrigat d and are ordinarily too dry for the culture of most varieties of grapes, unless they are given some water during the late summer months and especially after a series of dry years, which Southern California is liable to have. Fortunately, we have a grape that is particularly adapted to these conditions and in fact gives the best results in such situations. This is Cinsaut, a purplish black grape that resembles the Black Malvoisie, though the bunches are shorter and more compact than the last named. It is an excellent table grape though it is rather tender for shipping purposes. It must be picked soon after it matures or it will lose its good qualities, the berries will get soft and the fine flavor disappears.

The vine is not large but is very thrifty and retains its dark green foliage long after most other varieties show signs of suffering from the lack of water. Its habit is low and spreading, canes a bluish cast when ripe and the buds are very susceptible to frost. The buds will sometimes be injured before they open, with frost, while other varieties much further advanced will not be injured in the least. This characteristic is not such an undesirable one as the variety does best on high and dry mesas and late frosts seldom if ever occur in such places. These qualities emphasize its adaptability to high and warm locations. In the center of the Pomona valley it is a good variety, but in the lowlands of the Chino Ranch it is a decided failure, making a poor flavored, watery grape.

The literature of the grape says that the Cinsaut is widely distributed in the south of France, from the Alps to the Pyrenees; it yields a heavy bodied, but delicate and highly flavored wine and for that reason is largely used in blends, to which it imparts its fine aroma which is best developed at about the age of four years. It is, however, a most excellent table grape. The grape develops its best quality on the warmest slopes of dry, stony hills. On light soils, its life is not long, unless sustained with fertilizers and by very short pruning. It requires a good deal of heat and ripens in the second period.

In the Santa Clara valley this grape has been grown under the singularly inappropriate name of Black Pinot. It is one of the many so-called Burgundies of that region which seems to include every grape yielding but little color. Of course its extra large bunch and berry, its glossy, deeply cut leaf, and low growth distinguish it from the true Pinot and from nearly every other of the misnamed Burgundies.

The French observation that it develops its best qualities on dry hills, is well verified in California. On low, moist soil it makes a tasteless, watery grape of high acid and low sugar content and lacks the peculiar aroma that constitutes one of its chief merits. To the fact that it was first planted in the cool coast region of the Santa Clara valley must be attributed the slight degree of appreciation it has thus far received. It belongs to the warmest parts of the state and should there be propagated for the production of both dry and port wines.

This grape has met with much favor by those who visited the Pomona station and it was always among the varieties distributed from that place. It was a general favorite for those planting for home use and some shippers have secured vines of that variety with the idea of shipping to the home markets. It will produce a little better than four tons per acre, take it one year with another.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

PRUNING THE FIG.

Mr. Geo. C. Roeding, perhaps the best authority on fig growing in California, believes in pruning the fig for the first three years. He advocates cutting the tree down at planting time to within a foot of the ground and leaving not more than four branches to form the head of the tree. These branches are to be distributed so that each will have ample room in which to spread and expand without crowding when the tree gets old. The following year he cuts these branches back not more than half, leaving not more than three branches on each of the previous year's growth. The third season, the branches are shortened about one-third and the same number of branches left on each new branch as was left the previous year. This gives the tree a good form and gets it started more upright than less pruning would. The fig is naturally of a low, spreading habit and it is necessary to keep the lower branches pruned off, and this with cutting out branches that crowd or cross, is all the pruning required after the tree has been shaped as described.

SAN JOSE SCALE.

The San Jose scale when very abundant kills the trees and also attacks the fruit, causing small circular reddish blotches wherever it attaches itself to the apple or pear.

In the early stages of infestation a few scales may be found, usually about the rings and rougher parts of the limbs or on the crotches of the tree.

The infested apple trees that the writer has inspected during the winter have practically all of the scales on the lower parts of the main trunk and larger lower limbs. The younger and newer growth toward the ends of the limbs show very few, if any, of the insects. A large number of the insects on these trees have been found dead. Although the San Jose scale has been known in the valley for about 15 years, it does not seem to spread much nor has it been a very serious pest.

Many of the insects perish during the winter, but each female of the over-wintering generation is capable, under favorable conditions, of producing about 100 young. So, realizing the rapidity with which these insects increase, it is not surprising that even a few active females in the spring may completely infest the tree. Here then lies the great importance of thoroughly spraying the trees during the win-

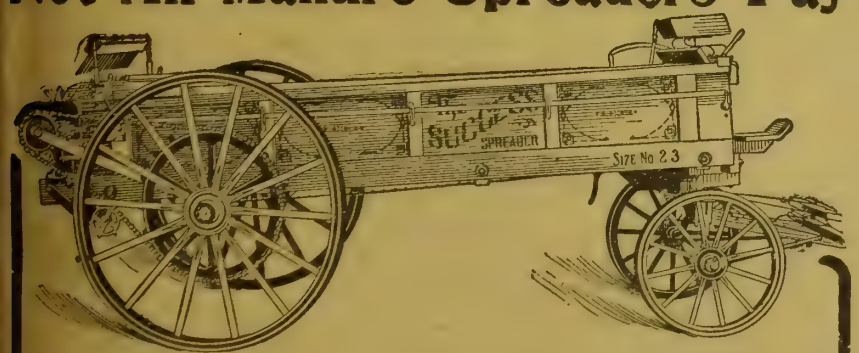
Not All Manure Spreaders Pay



The Idea of spreading manure properly is such a good one and the benefits derived are so great you are apt to think *any* spreader will give you these benefits—that a spreader is a spreader.

There is where you may make a mistake, for some spreaders are only trouble makers and the second season they are not taken out of the shed. To make them work takes too much time and costs too much money.

If you get that kind of spreader you're apt to conclude that spreaders are made to sell and not to spread manure.

SUCCESS SPREADERS

have 28 years' experience back of them—thousands of them are spreading manure on the best farms in the country and are giving no trouble.

Twenty-eight years has eliminated the trouble making features—out of a hundred new devices and schemes that we have tried perhaps ninety have proved more harmful than helpful. They make good talking points but they don't help spread manure. SUCCESS Spreaders are made to spread manure.

When you get ready to buy a manure spreader, (and every farmer should have one) first write for our spreader book, it will help you; next go to your local dealer and see a Success Spreader but don't buy one until you have asked a man who has used one. He knows.

ter or spring. Every insect should be destroyed or else the tree is likely to be reinfested during the season.

The insect belongs to the sucking kind, which must be killed by contact sprays. Many of these sprays have been used from time to time with good results but the one now universally used is the "lime, sulphur, salt" spray.

This remedy, according to recent reports, is the leading one for the San Jose scale. The materials used in the preparation of this spray are good unslacked stone lime, flowers of sulphur, salts and water.

The results of the more recent investigations in other states show that the lime and sulphur wash, without salt, has been practically as efficient as with the salt added to it. The salt can be added to the mixture if one wishes to do so, but it does not seem to be necessary.

Lime-Sulphur Formula.

Unslacked stone lime	20 pounds
Flowers of sulphur	16 pounds
Water	50 gallons

In preparing this spray mix the sulphur into a thin paste with just enough water to break up all the lumps. Take a large kettle with 15 gallons of water, place it on a fire and heat it to the boiling point. Add the sulphur paste to the boiling water and mix it thoroughly.

Then add the 20 pounds of stone lime and while the lime is slaking stir often and vigorously enough to keep the lime and sulphur well mixed. Keep the mixture boiling vigorously for at least an hour or until a dirty orange red color appears. If salt is to be used with lime and sulphur, 10 pounds can be added at any time as it dissolves quite readily.

When the mixture has boiled long enough it is ready to be strained into the spraying barrel and diluted to the 50 gallons. It is better to dilute the wash with warm water. The diluted mixture should still retain its orange red color. If a light yellow color appears the wash has not been boiled long enough.

The mixture should be taken immediately to the orchard and sprayed upon the trees while still warm. If the wash cannot be used all at once it should be kept warm in the kettle.

The time to spray for the San Jose scale with lime-sulphur wash is while the trees are dormant, that is, any time during the winter and spring. In badly infested orchards more satisfactory results will be secured by spraying twice, once in the fall and once in the spring. In lightly infested orchards one spraying carefully and thoroughly done will give very satisfactory results.—Fabian Garcia, New Mexico Experiment Station.

STABLE MANURE.

In using the manure from the stable or barn yard, the truck gardener needs to have them piled and reduced to a fine condition by slow fermentation. Coarse and fresh manure that a farmer can use on a grass sod profitably will not do for him. Thorough decomposition is essential to get the mass in a state in which it will give up its plant food most readily.

Piling and composting, while seldom profitable for the grain farmer, is of importance to the gardener. Those who are so situated as to be able to get the sweepings from paved streets can profitably use this material for composting with their stable manure, and the black mold from the forest can also be used to advantage.

These materials should be put in thick layers with the manure in a broad, flat-topped pile, which should be chopped down perpendicularly, and thoroughly mixed by turning several times before using. The object is to keep up a slow fermentation and to check injurious heating, thus getting the pile into the condition of a black moist mold, suited for use in the hill or broadcast, as occasion may dictate.

Only One "BROMO QUININE"

That is LAXATIVE BROMO Quinine. Similarly named remedies sometimes deceive. The first and original Cold Tablet is a WHITE PACKAGE with black and red lettering, and bears the signature of E. W. Grove. 25c.

A shipment of six cars of cattle from Inyo county, with 666 head more en route to the green fields of King county, indicate good pasturagee in the latter locality.

MORE ABOUT HORSES.

THE unsound stallions—even the one with minor defects—should not be used;—it will not pay. I notice in the article of February 7th, I have, in speaking of the cheaper stallions used the word unsound. I should have said sound but without style. That is the way it is in the notes but I may have miscopied it for my mind has been full of State Federations. Social Betterment, and three Farmers' Institutes that came one after the other. I wish to say emphatically never, never use an unsound animal for a sire. There was a time when I thought that the unsoundness set up my disease, as broken wind did not matter, but I now believe we have a weakened condition from chronic ailments.

Work Good for Dam.

In the case of mares that have had bad barb wire cuts and been bred and turned out to pasture, the colts dropped were not as good as those of the mares that worked. I believe slow work with plenty of grain fed to the dams almost to within foaling time, gives the best colts. The mares that run at pasture in foal do not have as vigorous colts, neither do they have as large a flow of milk.

A horse is no better than his legs allow him to be. He is an animal that is kept principally for his powers of locomotion. If the legs are impaired he should be carefully cared for until again in good order, or he should be disposed of humanely. An old crippled horse is often, in mistaken kindness, turned out to pasture. The horse is a civilized animal, he has been groomed, had his feed put before him, has been watered, talked to, made a friend of all his life, praised for right doing, scolded for doing wrong; then the day comes when he is no longer useful, when work is a weariness, when he no longer dances down the road. His kind master turns him out to pasture, he wanders alone, he must hunt his food, no one talks to him, his skin becomes full of dust and dirt, he has no warm stall at night, the chill strikes in as the blood moves slowly through his veins. Poor old horse, full of aches and pains, he shivers along through the winter in the wet pastures, and in the summer his coat grows rusty with the heat, his wisp of a tail does not keep the flies from his back, his worn teeth cannot work on the dry grass, he lingers along until death mercifully disposes of him. When you cannot profitably use the old horse any longer at chores, kindly have him disposed of and bury him with all honor under the green grass in the meadows he loved when he was young.

Care of the Hoofs.

The wounds or injuries to the hoofs of a horse are made dangerous by the hard horn keeping in the pus formed, often causing blood poisoning. Nail wounds that penetrate the quick are a source of trouble. Here in Fresno many horses are not shod and the sharp granite sand works up in between the walls of the hoof and the foot, the horse becomes lame, pus oozes around the coronet and a dangerous condition of inflammation ensues.

The horn of the hoof should be cut until the pus burrows are open to the air. The horn will grow as readily again as the finger nails, but it must be pared carefully or it may come out deformed. 1-500 solution of bichloride of mercury should be forced into the wound. After washing the wound thoroughly cover the cut portion with absorbent cotton soaked with the same solution. Leave the cotton standing up high and the bandage of cheese cloth covering the whole foot, soak this in creolin, and coat with either water glass or plaster paris. The horse can walk around if he desires without injury to the foot. Every day inject into the cotton standing above the bandage enough of the bichloride of mercury solution to saturate the cotton next to the foot. After a week cut off the bandage and put on a new one, after thoroughly cleansing the wounds and entire foot.

The old idea of cow manure poultice to wounds has killed with lockjaw many animals. The idea of putting filth into a wound seems preposterous, yet we sometimes see it recommended even today.

Keep Hoofs Clean.

Thrush is a foul place in the frog of the horses foof. This is believed to come from filth and be contagious. A hoof affected should have the frog cut clean and blue stone applied to the sore. Then clean the stable floor, take out dirt for four inches, put in fresh earth and stamp it down, using crude oil to mix with the earth.

In cleaning a horses feet before cutting for any wounds, scrub the foot with warm water and soap until clean, then wash with hot water, have some newspapers and fold them with a clean piece of cloth on top and rest the foot on them instead of the stable floor, until all dressing is complete. Burn the papers and cloth as well as all removed dressings from wounds. Keep all solutions clean having white granite ware bowls for this purpose. Where wounds are open and cannot be sewed up, a dusting of tannic acid and iodoform is put on the wound, or it may be thoroughly cleansed with the bi-chlodide of mercury and a slacked lime dusted on the surface.

In California the dry summers often make a horses hoofs brittle and the following is a good cheap hoof ointment: 1 quart cotton seed oil and 2 ounces creolin. If it is desired to col

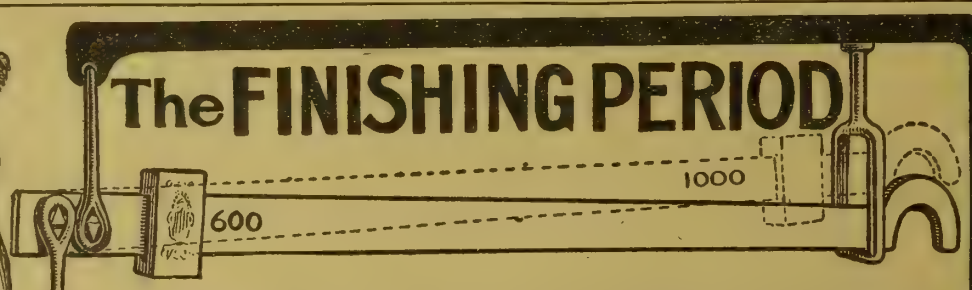
STERLING MILK CO.
Room 232, 411 So. Main St., Los Angeles

The FINISHING PERIOD



It requires more feed to produce 100 pounds gain on a fattening steer the second six months than it does the first, and more each month thereafter than the month previous. The advantage of early marketing is evident, but early marketing requires skillful feeding. Every function of the digestive apparatus must be kept in perfect condition. The matter of growth is a matter of digestion. Crowding is always dangerous unless certain precaution is taken to assist nature in eliminating or expelling from the system, waste and poisonous residue that is sure to be deposited under heavy feed.

DR HESS STOCK FOOD A TONIC

the prescription of Dr. Hess (M. D., D. V. S.) contains bitter tonics which act upon the digestive organs, strengthening and improving them so that the largest possible amount of nutrition is appropriated to building bone, muscle, milk fat, etc., and besides looking after the supply, it also takes care of the overflow—it contains the nitrates which assist nature in expelling through the pores of the skin, and in the urine, those elements that would be harmful if allowed to linger in the system. Furthermore, Dr. Hess Stock Food furnishes iron, the greatest known blood builder, and is mildly laxative, regulating the bowels during the period of dry feeding as though the animal was on pasture, and relieves the minor stock ailments. That bitter tonics, iron, nitrates of soda and potash produce the results above mentioned we refer to Professors Quitman, Winslow, Finlay Dun, and every medical writer of the age, and sell Dr. Hess Stock Food **on a written guarantee.**

100 lbs. $7.00. 25 lb. pail $2.00
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our government recognizes Dr. Hess Stock Food as a medicinal tonic, and this paper is back of the guarantee.

FREE from the 1st to the 10th of Each Month—Dr. Hess (M. D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

it, add an ounce of lamp back. This can be used all over a horses feet, inside and out.

Winter Care.

The California winter is often hard on horses,—during the day they sweat freely and (at night the chill comes) remain wet until morning. Blanketing them does not help the matter for they are wet all night under the covering.

They grow weak and thin under these conditions. If the horse is wet in the morning then the owner should have him clipped, a rough blanket made of barley sacks can be quickly run together and put on at night. The horse will improve in condition at once.

There is a prejudice against clipping mules; they seem to be sensitive to cold, taking pneumonia if the hair is removed over the spine. The majority of people have them given the cart horse clip, simply removing the hair from the legs and stomach. This keeps the legs dry in muddy weather.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

LIVE STOCK IMPROVEMENT.

Sufficient live stock should be kept on every farm to consume the roughage and some of the grain produced on the farm. This is not only necessary in order to maintain the fertility of the soil, but it is necessary in order that farming may be profitably carried on.

A general farmer should raise well-bred stock, but not necessarily pure-bred. In fact, he can hardly afford to raise pure-bred cattle, sheep and hogs for the block, or pure-bred horses to work in the field at the present market value of pure-bred animals.

The breeding of pure-bred stock is the work of the specialist. The general farmer should purchase and use pure-bred sires in his flocks and herds, and should breed his mares only to the best stallions, but he cannot afford to keep a one-thousand-dollar team of pure-bred mares as work-horses, even though they may raise colts each year, when a three-hundred-dollar span of horses or mules will do the work and good grade mares will raise colts when bred to pure-bred stallions which, as a rule, will bring the average farmer as much money in the horse market as though they were pure-bred.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

True, if the plan of breeding only from pure-bred sires is practiced long, the animals on the farm become practically pure bred, and it should be the aim of every stock raiser to ultimately secure such a herd or flock.

It pays to give the best of care to well-bred stock. The scrub is usually kept at a loss anyway, and it may not make so much difference financially what care the scrub receives, but with money invested in well-bred stock, which is capable of returning a good interest on the investment with proper feed and handling, neglect becomes costly.—Prof. Ten Eyck, in Kansas Farmer.

PRODUCTIVE AGE OF COWS.

A bulletin from the Wisconsin station states that a cow is at her best during the fifth and sixth years, up to which time the production of milk and butter fat by cows in normal condition increases each year. The length of time the cow will maintain her maximum production depends upon her constitution, strength and the care with which she is fed and managed. A good dairy cow should not show any marked falling off until after ten years of age. Many excellent records have been made by cows older than this. The quality of the milk produced by heifers is somewhat better than that of older cows for a decrease has been noted of one-tenth to two-tenths of 1 per cent. in the average fat content for each year until the cows have reached the full age. This is caused by the increase in the weight of the cows with advancing age. At any rate, there seems to be a parallelism between the two sets of figures for the same cows. Young animals use a portion of their food for the formation of body tissue, and it is to be expected, therefore, that heifers will require a larger portion of nutrients for the production of milk or butter fat than do other cows. After a certain age has been reached, on the average seven years of age, the food required for the production of a unit of milk or butter fat again increases, both as regards dry matter and the digestible components of the food. A good milk cow of exceptional strength, kept under favorable conditions, whose digestive system has not been impaired by over-feeding or crowding for high results, should continue to be a profitable producer until her twelfth year, although the economy of her production is apt to be somewhat reduced before this age is reached.

DEMAND FOR YOUNG PIGS.

There is, especially in the vicinity of large cities, a brisk demand throughout a good portion of the year for young, succulent pork. It is not a difficult thing, now that such marked improvement has taken place in the stamp of pigs kept throughout the country—the old, high-backed, long-snouted, gaunt-looking animal having almost entirely disappeared—to breed a stamp of pig that, plump and well-rounded from the first, can be got ready for pork in a surprisingly short time. Pigs destined to be fed as porkers should be weaned gradually, and not too early. As soon as they are able to eat, give them, in a low and roomy trough, long enough for each of the litter to get an equal share, a feed of good thirds and fine sharps mixed with skimmed milk. This should be fed warm if the weather is at all cold, and should have the chill taken off even in summer.

Give just what they will speedily eat up twice a day. Overfeeding should be guarded against, for young

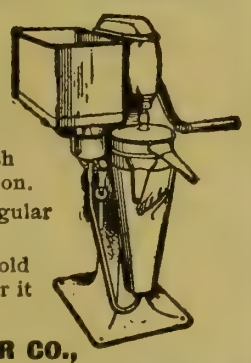
1½ lbs. more butter

If you can increase your butter production without any increased cost or any more work won't it pay you to do it? And if you can get more butter from you milk with **less work**, that will be still better, won't it? That's exactly what you can do if you will do as MR. LEITING did—buy a **Sharples Tubular Separator.** Here's what he says about the Tubular:

Randolph, Nebraska, Feb. 15th, 1906.
Gentlemen:—On the 23rd day of January, 1906, I took a No. 4 Sharples Tubular Separator on trial. On learning that I was in the market for a cream separator, the agent for the disc style "bucket bowl" separator brought one to my farm and requested me to give it a trial before making a purchase. After giving both machines a fair trial, I concluded to keep the Tubular as I consider it far superior to the other machine. It skims closer, runs easier, and is very much easier to wash, there being so many less parts. **From three skimmings of milk from 7 cows, we were able to make 1½ lbs. more butter with the Tubular than we could with the "bucket bowl" machine.** B. LEITING.

The Sharples Tubular Separator

MORE BUTTER MORE MONEY



gets all the cream there is in the milk, does it so easy that it's not work to run it at all, and is so simple, with only one little part in the bowl to wash and keep clean that comparison is out of the question.

The extra cream it gets makes the **Tubular** a regular savings bank for its owner.

All the other good money-making points are told in book F-260, which you ought to read. Write for it today—we'll send it **free** to you.

The Ornamental Garden

By ERNEST BRAUNTON

JERUSALEM CHERRY.

THIS plant belongs to that most interesting genus Solanum, which includes the night-shade, the potato, egg-plant and the garden pepper. These are only a few of the 901 species of the genus, which, according to Bailey the monographer Dunal recognized in 1852.

The Jerusalem cherry and the celestial pepper are two varieties best known to the florist and are perhaps more extensively grown today than ever before. They are sold by the thousands in eastern cities as pot plants and only of late years has their value as an ideal Christmas plant been recognized. Sow seeds of the Jerusalem cherry now.

Transplant the seedlings into flats, later pot them and give them field culture during the summer months. Pinch the little plants back to keep them stocky and dwarf. Repeat this while the plants are in the field, and up to the time they begin to bloom. They will be set with green fruit by the end of September. When lifted give them pots according to their size, and remove them to a house. A daily spray required while they are inside, to keep the foliage in good order. If there is a lot of small plants in the field put five or six into one big pot, but most likely the plants will be larger, as they will thrive in almost any soil during summer with very little care. In this way you will have Christmas house-plants covered with handsome red berries which remain on the plants for months.

ACACIAS IN CALIFORNIA.

The magic wand of Fairy Spring has touched the acacias and released their golden fragrant glory. Imagination cannot depict a more enchanting transformation scene and the footsteps of the most indifferent are arrested in admiration and astonishment. The desire to know the names of the different kinds is at once elicited but is not always readily gratified. There is a good deal of uncertainty as to the species of this group and much patient investigation remains to be done. To endeavor to learn even all the species cultivated in the parks and gardens of this city, would be a task for a specialist, but it seems possible with a little patience and by means of a few simple observations to distinguish those now most commonly noticeable. This is an attempt to do so briefly without entering into technical botanical niceties.

It will be observed then that the acacias at once divide into two groups, one group having what we will call flat leaves, and the other feather leaves. Out of a list of ten which I have selected to mention, three are of the feather leaf kind, so we will dispose of them first. Many a footstep on the way to the Smiley Library has been stopped to pay a tribute of admiration to the acacia mollissima, at the edge of the path. This then will be our type for the little group: A. mollissima, A. dealbata and A. decurrenes. The first two are often confused in trade lists and in herbaria and the botanical descriptions available do not throw a very good searchlight on the subject, However mollissima, as the name implies, has a softer appearance than the other two and the rays of the leaves are closer together on the stem, giving a more compact appearance to the leaf. In mollissima the young unopened leaf is covered with a yellowish fuzz; in dealbata it is whiter. The leaves of these two species are both more or less hoary. A. decurrens is a darker looking tree. The leaf is much like mollissima, but the leaves are shiny as compared to the others. The flowers in these species are in globular heads. They are all trees.

We now come to the flat leaved species on our list. Some have the globular flowers and others have them in spikes resembling the catkins of the male willow. Acacia cultriformis has the flowers in clusters of globular heads and A. longifolia in catkin-like spikes. The leaves of cultriformis are very white and are triangular and vertical to the stem, giving a striking effect. It is called fish-scale acacia, but it is to be hoped admirers will not use this name.

In view of the forgoing notes the following tentative key may be found of assistance by some readers:

Leaves feather like—

Rays very crowded. Leaflets more or less mealy, A. mollissima.

Rays more remote. Leaf more open and airy. Leaflets more or less mealy, A. dealbata.

Rays crowded. Leaflets not mealy, A. decurrens.

Leaves flat vertical to stem, flowers globular—

Leaves triangular about one inch, white, mealy, shrub not spiny, A. Cultriformis.

Leaves somewhat smaller, shrub spiny, A. armata.

Leaves flat, not vertical to stem flowers globular, yellow—

Leaves long, 6 to 12 inches; one nerved, pointed, A. cyanophylla.

Leaves 3 to 5 inches, A. neriifolia.

Leaves flat, not vertical; flowers pale yellow—

Leaves several nerved, A. melanoxylon.

Leaves flat flowers in spikes, A. longifolia.

The most gorgeous sights at present are: A. cultriformis, A. mollissima and A. longifolia.

A. dealbata is coming into bloom ant. A. neriifolia.

Cyanophylla comes to the trade as saligna, and I am not sure of it, but it seems more likely to be cyanophylla.

Neriifolia is known as floribunda and as retinodes.—L. A. Greata, Redlands.

FLOWERS ON THE FARM.

During the past few years the best thought of many able men and women has been given to the conditions of the farmer and the status of agriculture. Many movements looking to the betterment of rural affairs are now in progress. It is probable that every one of them is productive of permanently good results and the combined effects must be most beneficent. However, the pecuniary side of the agricultural question has been too greatly emphasized in these schemes. It is, of course, incontrovertible that the greatest single problem is that of the earning power of the farm; but it is not all.

Great numbers of farmers earn enough as it is, but they may not have the knack of doing things with the greatest economy of time and effort, and consequently farm homes do not always afford the greatest pleasure and comfort of living. Every person should know the great fact that the most successful life is the happiest one.

Like or dislike of the farm is often, and probably generally, formed before the child is old enough to be greatly influenced by the profit-and-loss side of farming. A pleasant and happy home is the very first means of keeping the boy on the farm. One means of making the home attractive is to brighten the place with flowers.

THE PICTURE.

The open-centered yard may be a picture: the promiscuously planted yard may be a nursery or a forest. A little color thrown in here and there puts the finish to the picture. A dash of color gives spirit and character to the brook or pond, to the ledge of rocks, to the old stump, or even to the pile of rubbish.

The Vegetable Garden

By ERNEST BRAUNTON

AIR IN THE SOIL.

ROOTS need air as much as leaves do and unless they get it they will not long remain in health. When the roots are sickly it is only natural that the plant will be sickly too, as the requisite nourishment is not forthcoming.

The ordinary pressure of the atmosphere is sufficient to force air between the particles of soil in which plants are growing, when this soil is in a dry or moderately dry condition, but when it is heavy and waterlogged, a frequent condition where plants are carelessly watered, then the air pressure is insufficient to drive out the water. The fact of the soil becoming dry is in a negative way a benefit to the roots growing in it, for it paves the way for a fairly heavy watering, and this watering carries down fresh air to the soil interstices. This is only a hint, but just think it over, for there is more in it than appears at first, and these rules do not apply alone to the vegetable garden, but to every crop grown.

REQUISITES OF PINEAPPLE SOIL.

The first essential feature to be considered in the selection of a soil for pineapple culture is the temperature to which the locality is likely to be subjected.

In Florida the bulk of the pineapples must be grown south of latitude 28 degrees, as north of this, and indeed for thirty or forty miles south of this line, killing frosts are likely to occur any winter. The fruit is grown many miles north of 28 degrees, but protection from cold by means of close sheds and artificial heat is necessary. This is so expensive that only fancy varieties can be profitably grown under such conditions.

Latitude alone does not determine how low the thermometer may be expected to register, for we have what are termed cold streaks far south of localities where frost rarely occurs. Proximity to large bodies of water materially influences the temperature of a locality. The water, on account of its great capacity for absorbing heat, becomes warm during the day and at night when the temperature of the air drops the heat absorbed by the water is slowly given off and in turn moderates the temperature of the surrounding atmosphere.

Another factor which has a decided influence is that of elevation above the surrounding country. Such a point well elevated above a considerable area is heated by the warm air which rises from the lower level. It is a well known fact that warm air is lighter than cold air, and when frost occurs it is found decidedly heavier in low places. Cold air drops into these depressions and forces the warm air upward, so that the elevated points are not chilled so much as points on a lower plane.

STARTING BANANAS.

Large offsets, from six to eight months old and having well-developed corms, have found much favor in many of the best banana-growing countries. Select those whose first leaves are arrow and sword-like.

It is essential with such plants that they be cut back to within about six inches of the corm. Some have failed by setting large plants without cutting them back and so have been led to believe that the very small offsets are better. These larger plants are further prepared by the removal of all the old roots.

It is regarded as best to allow them to dry for at least several days before planting, and many experienced growers prefer to place them in heaps eight to ten deep, covering them lightly with trash, and allowing them to remain for a month before planting. After being set the central shoot may or may not grow. It is a matter of indifference whether it does or does not, for a bud from the side will make an excellent plant.

Small offsets, from a few weeks to two or three months old, are also used. The youngest of these cannot be recommended, but the older ones make fair plants. They are usually cut back when they are dug. The old roots should also be removed. Vigorous plants should be selected with well-developed corms, with stems tapering to a point and the first leaves narrow and sword-like.

PURCHASE OF FERTILIZERS.

First of all buy only from reliable firms, if possible, direct, but if you must buy through an agent or retailer see that he obtains his goods from responsible manufacturers.

See that the phosphoric acid is supplied in a readily available form, else it will not do much good. The water soluble form is the most valuable one, being immediately accessible to the plants. The citrate soluble or so-called available form is not quite so good, whereas the insoluble form is generally of very little value.

Be sure to obtain a full guarantee from the manufacturer or his agent, of the actual plantfood content. This will protect you against fraud from unscrupulous dealers. The State experiment stations generally analyse samples free of charge. Always get the best to be had, as it is the cheapest in the end. Good fertilizers must have a uniform appearance throughout the whole sack, they must be dry and fine.

STRUCTURE OF AN INSECT.

The body of an insect is made of a series of segments or "body rings" divided into the head, the thorax and the abdomen. The first two divisions of the body bear certain appendages characteristic of all insects, namely the antennae or "feelers" and the mouth-parts of the head, and the legs and wings of the thorax; there being always in the adult insect three pairs of legs and usually one or two pairs of wings. The segmentation of an insect is well shown in the abdomen, not so clearly indicated in the thorax, and in the head fusion has progressed to such an extent that this part of the body appears as a box-like structure. The skeleton is external, that is, the internal organs of digestion, the nervous system and the respiratory system, as well as the muscles of the body-wall, are supported and protected by a hard shell-like covering. This covering or chitin is so deposited in certain places as to form a hard and resistant surface, while in other places it is flexible enough to permit a free movement of the body as a whole or the functioning of its various parts.

Increase in size, or growth, is provided for by shedding from time to time, during the young or developmental period, this outer covering. This process is called "molting" and these changes of skin mark the early stages of development in insects.

It is understood that no great acreage of cantaloupes will be planted about Exeter and Lindsay this year. The shortage of cars last season with no better prospect for a larger supply this, has had a tendency to put a quietus on the business.

Farmer to the garden goes

With the Citrus Growers

By J. W. MILLS

WINTER IRRIGATION.

THE practice of winter irrigation can ordinarily be employed on orange groves, but there are situations where it is impracticable. The theory is a good one and wherever it can be put to use, surely ought to be employed. It may now be more generally used to advantage than formerly on account of the more general practice of growing green manuring crops. This not only increases the necessity of using winter irrigation water, but renders its use more effective.

Where large quantities of water is used on bare land, it tends to pack the soil, which is, of course, overcome by subsequent cultivation, but when the soil is filled with roots of the green-manuring plants, the soil does not pack. The increased growth of these green crops by having the extra amount of water, increases the loosening of the soil to a greater extent.

This action of the growing plants makes subsequent irrigations more effective. There is no doubt that the application of extra water while the plants are growing in the winter time will increase their growth. Even when the soil is abundantly moist from the natural rainfall, a very light irrigation will aid the growth of green crops during the dry periods between rains occasioned by the dry desiccating winds which come from the north.

The item of picking the fruit comes in on the winter irrigation question. It is quite common in the Riverside section for growers to pay a lump sum for winter water and use as much or little as they please. It is possible under these conditions to use the water economically by dividing up the runs and put the water on such sections of the grove that are not to be picked immediately. After a picking has been made the work is of course simplified. One of the most successful growers of Southern California makes a practice of giving a heavy irrigation at this time so as to have the soil full of water at the beginning of the season.

This is an important matter where green manuring crops are grown. They use up the supply constantly when growing, and after they are turned under, it is important that the soil is wet enough to decompose the green stuff rapidly. The acidity that always accompanies the decomposition of these green crops, helps to keep the phosphates in an available form and with abundant irrigations to carry the soluble elements down while they are still in that condition and brings them within reach of the feeding roots.

We are told by the authorities that the phosphates soon revert to an insoluble form in water as soon as they come in contact with the lime in the soil. If they can be delivered to the points where the feeding roots take them up, as soon as possible after contact with the acids formed by the decomposition, there will be less liability of loss through reversion Should heavy rains follow closely after the decomposition of the green crop, it is much better than an irrigation from the ditch, because the rain water is free from lime and alkaloids, and contribute to an ideal condition.

But it must be remembered that the rain water will start back again to the surface as soon as the top of the ground gets dry and before it gets dry, and if at that time a good, long soaking from the irrigation ditch is given, the elements in solution with the rainwater are driven further down. This is an incident in the scheme of winter irrigation. The main idea is to start at the beginning of the season with the soil full of water. This starts the trees off under the most favorable conditions and less water is required during the summer months to accomplish the desired end.

This heavy winter irrigation is entirely wrong under certain conditions. These are soil conditions which cannot be determined, except by a careful examination of the subsoil. A soil that has a hardpan at a depth of a few feet cannot be treated in such a way or the trees will be injured by the subsoil water. An orchard on a loose gravelly subsoil cannot be so treated either, as the water would simply run away and be lost. Such a soil must be irrigated often and little at a time.

POULTRY MANURE.

Poultry manure is sometimes credited with being a very rich fertilizer, but such is not the case. It is perhaps not worth more than $4 to $5 a ton. One hundred pounds of fresh droppings contains about .05 of a pound of phosphoric acid, .56 of a pound of potash and 1.10 pound of nitrogen. Figuring potash and phosphoric acid at 8 cents a pound and nitrogen at 16 cents, one hundred pounds would be worth a little over 22 cents.

In order to get the full value out of poultry manure, it must never become dry. It contains a large amount of silica in solution and when this hardens, it is not soluble in water, but must be heated with acid before it can be liberated. This solidified silica surrounds the fertilizing ingredients and imprisons them. The presence of this undesirable substance, is due to the fact that the chickens swallow a large amount of gravel and sand with which to masticate the food. The acids of the intestines of chickens dissolve a good deal of this and it is mixed with the droppings.

The best method of handling poultry manures is to collect it each morning and keep it in barrels or boxes and sprinkle it just enough to keep it moist and throw it in the irrigation furrows while the water is running. This is good practice on a considerable scale where poultry is raised in conjunction with fruit growing, but with the person with a few hens it is not worth while. A good arrangement is to sink a box in the ground with the top level with the surface. The droppings could then be raked into the box in the same operation with cleaning from under the roosts.

The outlook for the bee men this season is especially good in Kings county. Last year's crop of honey is about all out of the warehouses Feed for the bees will be plentiful this spring, as there wil be a great variety of wild flowers in the fields and hills.

The fine weather of the last few days has allowed the farmers around Willows to plow their ground and get it in shape for spring crops; 70 acres of alfalfa will be put in. This looks like the farmers are going to be in a position to supply milk for our creamery, which will open for work early in the spring.

NEW VARIETIES.

This paper has repeatedly cautioned growers not to rush into new and untried varieties of oranges, even if they are apparently a much improved strain of our best sorts. It is hard to tell what weaknesses will develop, and only several years trial will prove these new sorts to be one thing or the other. Thompson's Improved was perhaps the most widely planted of any new strain of our Washington navel. It came as a pioneer in the list of improvements. The fine texture of the skin, thin rind where other oranges produce a thick rind, early ripening and good shipping made it prominent from the start. It has been a money-maker for some growers, but it has not added to the reputation of the California oranges for fine flavor. Some large growers have called it a wooden orange, because it is full of rag, and is not a juicy orange. The call for it from planters has not kept up to percentage that it formally did.

The same general remarks may be made regarding the Navelencia. It was considered a valuable acquisition when it first made its appearance, but it is seldom seen, and very seldom spoken of now.

Another fine appearing navel orange came out a few years ago as a sport, and has been called Cason's Golden Nugget. It is very fine in appearance, and is later in ripening than the regular navel. The trees are very willowy, and could appropriately be called Cason's limbertwig. We have been told that the fruit is in most cases badly damaged by the winds, the long pendulant branches not being stocky enough to resist the force of even ordinary winds. So it seems that the future navel orange must be one in which are combined the most desirable qualities already found in the "straight" Washington navel that is most universally planted. The orange is like fine live stock. Fundamental characteristics are apt to be sacrificed when fineness in quality is carried to excess.

A BACKWARD SEASON.

All farm and orchard work in the Sacramento valley is very much behind this season, owing to the inclemency of the weather. Steady north winds for days at a time, and then almost continuous rains ever since, have made this one of the most backward seasons, and little has as yet been done either in the way of plowing, planting, pruning or spraying. In short, all farm work is a month behind and the ground is so full of water that it is yet impossible to work it. The season, at best, will be late, although there is yet ample time for a good one. So far it has been beneficial for fruit, as the cold weather has kept the sap from rising and reduced the danger from late frosts. The great dread of the fruit man is a warm January and February followed by a frosty March. This danger is being reduced during the present season.

APPLICATION OF FERTILIZERS.

A proper application of the fertilizer is all-important. The question of broadcasting or sowing in drills depends entirely upon the crop to be sown, the nature of the soil, etc. The application should always be done from two to four weeks before sowing. Chili saltpeter is generally given later in the form of top-dressing. In all cases, the fertilizers must be mixed with the surface soil as intimately as possible. Never fertilize one-sided, but apply all the necessary plantfoods.

The Fresno Agricultural Fair Association, which was temporarily organized in Fresno a short time ago, has decided to incorporate with a capital stock of $100,000. The stock will be sold to ranchers, vineyardists and orchardists.

Notwithstanding the long rainy season there has been but little suffering among the stock in the vicinity of Madison. There have been but few fatalities among the sheep, cattle and hogs. The warm weather of the past few days has started the grass and there will soon be an abundance of feed. A few of the farmers have commenced plowing.

Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

San Dimas Citrus Nurseries

San Dimas, Cal.

Malthoid Roofing

There is no better covering for your poultry houses than Malthoid Roofing. It is offensive to insects, clean and odorless, and will remain proof against the severest cold and hot weather. Poultry houses covered with Malthoid are warmer in winter and cooler in summer than those covered with roofs of shingles, boards, tin, iron and many inferior grades of prepared roofing. Send for booklet.

SOMETHING DOING.

From the Congress of the United States to forty or more State Legislatures, including California's Assembly, statesmen are making laws to regulate about every thing and every body in the whole country. Up to the present writing laws have been enacted, or will be enacted, governing beef packing establishments, pure food and medicine decoctions, abolishing free passes on railroads, governing Standard Oil operations and prohibiting insurance combines. These are all good laws and in line with much needed reforms. Laws have been passed, or will be passed, prescribing more severe penalties for gambling, for wife desertion and child labor. In some states tipping and grafting have been hit hard. In others the primary election laws have been enacted giving the man a right to vote direct for the man he wishes to see nominated. This is a death blow to the power of the political boss. Taking the calendar as a whole, it covers, to a considerable degree, the frailties of human nature, and the question is, how much good can be gained by legislation along these lines when applied to the human family.

The effort to abolish original sin by legislation has never proven a brilliant success, and it is doubted if it ever will. The old world will go along about in the same old way so long as time will endure.

The tide of immigration, which has been unusually high during the last few years, continues to rise. During the six months ended September 30 the immigrants admitted to the country numbered 682,560, an increase of 87,000 over the same period of last year, and of 225,000 over 1904.

ARGUMENTS WHICH TELL.

At no period in the history of California promotion has the disposition to set forth the advantages of the state been stronger than at the present time. Sections of California heretofore neglected are coming to the fore with well-timed information of possibilities never known to exist in those localities.

We have in mind, as an example of this endeavor, Colusa county, which, through its enterprising Chamber of Commerce is disseminating valuable facts about its climate, soils and products. Situated about 100 miles north of San Francisco, in the heart of the Sacramento valley, this wonderfully productive territory gives promise of becoming one of the richest agricultural portions of the state. Up to this time the public was unacquainted with its resources. But a resumè of its products develops the fact that it is not only a fine stock country, one in which wheat, oats, corn and alfalfa are grown in abundant crops—but also citrus fruits. It is claimed oranges mature for market from two to three weeks earlier than in Southern California, and the trees are never effected by pests of any kind.

These are important features for the enlightenment of easterners seeking a California home, and the fact that lands sell from $35 to $100 per acre is an inducement to attract homeseekers to that county.

But Colusa is only one of many counties north of San Francisco, which are before the public at this time. The fact is, the entire north half of the state, the territory north of the Tehechapi is in the lime light of public attention and from this on will merit careful consideration in the minds of tourists and home-seekers.

That California, as a whole, is today the most observed, most discussed and most sought after by easterners of any state in the Union, is established beyond the shadow of doubt from the hundreds of thousands of letters pouring into it from every section of the land, from men and women desirious of finding the acme of climate and home conditions to pass the remaining years of their earthly career. Of a verity we are in the land of paradise and great and grand is our future. Let us get busy. Promulgate our surpassing country and its natural advantages; keep the ball of progress and improvement rolling right along, and we shall become the queen of the states in the constellation of the Union.

TELEPHONES ON THE FARM.

The wide extension of the use of the telephone in country life is one of the phenomena of our day. In a report recently received from Nebraska, it is stated that the extension of the telephone in that state is twenty-five per cent. over 1905. In Iowa the gain last year was about the same per cent.

Two things are shown in these reports. First, that the farmers are fast making the country home a counterpart of the city home, and, second, that the telephone has made itself indispensable to farm life in such a way that it is now regarded as one of the necessities of a rural place.

The general use and advantages of the 'phone in cities are well-known, but few city people are aware of the extent of its use in rural districts or of the many ways in which it has modified the conditions of country life. Like the locomotive, the 'phone "annihilates distance." It economizes time and locomotion by facilitating the exchange of ideas, dispensing thus with many obstacles to business and social intercourse. One of the advantages of great moment is the effect of the telephone in improving the conditions of farm life, making the country attractive to persons who could not endure the isolation and dullness of rural existence as it was formerly. Rural crime is more easily kept under, now that the country is cobwebbed with telephone wires. The report notes, for example, the assistance given by the 'phone to constables and sheriffs in suppressing the tramp nuisance.

The export trade in American butter is growing very rapidly. In 1904 and 1905 the amount exported was 10,000,000 pounds each year. In the fiscal year, ending June 30, 1906, it had increased to 27,360,537 pounds, the value trebling in the two years.

California Tussock Moth

Continued from page 211

While the larvae are normally quiescent for some time preceding the molts, they are, however, able to walk if disturbed, and may change their position before emerging.

The larger larvae often assume a wandering habit, which causes them to leave the original food plant and seek others, sometimes at a considerable distance away. Isolated larvae are often found on young trees several hundred feet from a nest. It is possible, also, that the very young insects may have been carried by the wind and birds and so aid in the general distribution. As the female moth is wingless, the distribution of the species must take place exclusively in the earlier stages.

The Mature Larvae.

When the larvae are fully developed they select somewhat protected places on the trunks of trees and the under side of branches, where they spin up sometimes in masses of cocoons; when the caterpillars are very numerous, these masses may be plastered over the trunk in the form of a blanket several inches wide. As the males spin up first they often form masses by themselves, the females spinning their cocoons elsewhere.

The caterpillars sometimes also spin up on the under side of bunches of leaves at the end of small twigs. The leaves are then securely webbed to the twig by the caterpillars before the cocoons are spun. The spinning-up habits of the caterpillar then result in a general distribution of the cocoons over the surface of the tree, as well as large masses on the trunks, and also on fences and other suitable objects in the vicinity.

The Moths.

When the moths emerge the males fly about in search of receptive females. The females have a greatly developed abdomen filled with eggs. The legs are fairly well developed, but the wings are rudimentary and unadapted for flight. The female is so heavy that it makes little effort to crawl about, but usually remains clinging to the mass of cocoons from which it has emerged. Here it also deposits the egg mass, usually attached to the cocoons, but sometimes is directly cemented down to the twig. The laying of the eggs takes place in a very few days after emergence.

The males are supposed to be attracted by the odor of the females, and will go considerable distances to find isolated insects. They have often been noted attempting to gain entrance to the muslin-bag cages where the females had emerged.

Mating may take place at once after the female has emerged, or a considerable time may elapse. The eggs are often laid within an hour or two thereafter. While laying eggs the female remains stationary, building up the mass by moving the tip of the abdomen to and fro. The eggs are deposited in a fibrous cementing material, which completely covers them and holds the mass together very firmly, and also makes a strong attachment to the body against which the mass is deposited. As the eggs are ejected the abdomen of the moth slowly contracts, making the insect very much smaller than it was before the egg-laying commenced.

The males fly during the day and also in the evening, or possibly all night when the weather conditions are favorable.

The larvae and female adults are remarkably hardy. The caterpillars can withstand long periods of starvation and will develop in confinement under conditions which would kill many other insects. Some larvae developed from eggs in a Mason jar with the lid closed down, their food for the most part being a rotten apple; but this diet was varied at times with some apple leaves sprayed with arsenate of lead

Another interesting fact about the larvae is their apparent sense of direction, for when beaten from the trees they lose very little time in finding their way back to the trunk. This ability to find the trunk of the tree seems to be due probably to vision, as any object such as a post standing erect will attract them. That the finding of the tree trunks is not due to accident can be readily seen, for when the caterpillars are shaken from the trees they soon form into lines which converge at the trunk, and only a few can be found aimlessly wandering about.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

The Chino Land Company shipped 500 steers to Los Angeles last week.

25 cars of potatoes of fine quality have been shipped from Hemet this winter.

The beet acreage about Oxnard as recorded now, is materially in excess of the crop of 1906.

All the tile drainage that can be done this year is finished, making 500 acres so improved at Chino.

Between five and six hundred cars of hay have left the Hemet station for the market this season.

Hemet is having a very early Spring. Fruit trees are all in bloom, and the grain fields are making rapid growth.

The Central Creamery Company has completed its arrangements for the erection of a creamery at El Centro.

The California Vegetable Union has begun shipping cabbages, a car being shipped from Olive this week, at $20 per ton.

The unusual moisture of January and February set back the beet crop about Oxnard very materially, but not seriously.

Central California farmers would like the rains to hesitate long enough to allow them to stir the soil between showers.

The beet contracts signed to date at Oxnard, are for more than 13,000 acres, with quite a large amount still to be agreed upon.

The express shipments from Escondido for the week were, 181 cases of eggs, 1650 pounds of chickens, 1310 of cream and 435 of butter.

Beet seeding is in progress now for next season's big sugar crop of the Chino factory. About 200 acres will be planted on the Chino ranch.

The following has been planted to trees on the Hemet Tract this Spring: —250 acres walnuts, 150 acres oranges, 100 acres apricots and 20 acres to peaches.

The condition of grain and hay in San Diego county has been improving. That now in ground is doing well, and the ranchers are busy adding to the acreage.

The alfalfa growers about Corona will soon be able to make the first cutting for the season. The recent warm, spring weather has advanced the growth and practically insures seven cuttings this year.

Last Wednesday the farmers near Heber met and formed an association to be known as the Heber Fancy Melon Growers' Association, and in the neighborhood of 250 acres of cantaloupes will be planted.

HORTICULTURE.

The rainfall to date at Whittier has been 15.72.

Riverside's rainfall to date has been 12.64 inches.

Total rainfall for the season at Fairmont 22.79 inches.

San Bernardino reports a season's total of 16.81 inches of rain.

This last rain brings the total fall for the season at San Jacinto to 13.58 inches.

The orange growers at Lemon are busy packing oranges at the new packing house.

The rainfall for the week at Escondido has been 1.08 inches, making 13.18 for the season.

W. N. Bradbury of Escondido, has 30,000 young eucalyptus trees which he will plant out at once.

The last storm dropped ninety-four hundredths of an inch at Chino, making the total to date 19.64.

Citrus growers in all parts of the State are confident of a fine yield and good prices for next season.

Nearly all sections of the south have had at least six inches of rain, to date, over the season preceding.

Harry E. Griffith of Ontario, has sold his five-acre gum grove east of Turner's orange orchard to Charles Land, for $1,000.

The Brawley Cantaloupe Growers' Association has over 600 acres of cantaloupes signed, and expect to have from 100 to 200 acres additional.

S. A. Pease of the San Bernardino Board of Horticulture writes: "The San Bernardino Horticultural Commission purchased for the year 1905, 76,000 pounds of cyanide, for 1906, 80,000 pounds. The cyanide gets the pests. Nearly every spray pump in the western part of the country is for sale.

Oranges are moving quicker this week from Fullerton. The C. C. U. shipped eight carloads during the past week; the Placentia Orange Growers' Association, five carloads (Benchley Fruit Company, six carloads (and two carloads walnuts;) Thomas Strain three carloads, and C. C. Chapman two carloads.

Northern California

AGRICULTURE.

Yolo county is rapidly becoming the leading live stock breeding section of the state.

Two carloads of horses and mules from Gridley, were shipped to Los Angeles last week.

Contracts for 4,000 acres of beets have been signed by the Pacific Sugar Company of Tulare county.

The H. G. Lacey Company of Hanford, has received a shipment of 17 carloads of wheat from Reedley.

Mrs. Susan G. Chamberlain, has sold her tract of one thousand acres in the Olive Hill colony, near Browns Valley.

The Colusa Herald says: "The road from here to Williams is now said to be ten miles long, 30 feet wide and 3 feet deep.

Messrs. O'Brien, Jones and Faria received a consingment of 2500 thoroughbred White Leghorn chicks from Petaluma this week.

The herds of pure bred horses, cattle, sheep and hogs owned in Central California are getting more numerous and more famous every year.

Dr. Frank Griffith of Inyo County, is making ready to inspect a large band of cattle that Mills and Aldwinkle will ship to that county.

J. H. Williams has sold two fine Holstein bulls, Sir Gerben Josephine to T. J. Ray, and Sir Mercedes Josephine to A. O. Swanson, both of Tulare.

Plans are being laid in the vicinity of Corcoran and Alpaugh for the planting of large tracts to sugar beets. At Corcoran 500 acres will be planted and at Alpaugh it is said that 1000 acres will be put in.

The hog market is still high and will probably remain so for some time. Local dealers are paying 7½ cents per pound, and it don't take much of a porker to bring from $15 to $20.—Sutter County Farmer.

The lima bean market is an enigma at the present time. Following two seasons of unusually large crops, and with the prospect of another bumper yield, there is a hold-over stock of about 240,000 bags. This is about one-third of the crop for the two counties of Santa Barbara and Ventura.

HORTICULTURE.

Monterey county has 650 acres planted to apple trees.

The average price for raisins this year will be better than last when it was about $3.70.

Several car loads of beans were shipped from Saticoy to eastern points during the past week.

Santa Cruz county is credited with having 32,000 acres in apples, 650 in apricots and 1200 in prunes.

From ninety Royal Anne trees Mr. Chubb, near Vacaville, sold cherries to the amount of $2,200, or an average of $24.40 per tree.

One orange grower at Sierra Madre is trying the experiment of shipping oranges to Los Angeles and Pasadena in bushel baskets.

P. B. Norton, traveling agent for the Southern Pacific, has secured 160 acres in the neighborhood of Goshen, and has set out already 14,000 eucalyptus trees.

Henry D. Foulk has purchased fifty-seven acres of land from the Oslands at Indian ranch, near Dobbins, and will plant an apple orchard on the property.

Several big tracts of land in Tulare county have been secured to be planted to eucalyptus trees, and only the scarcity of trees is preventing the work from going ahead.

The raising of eucalyptus trees, which is assuming the proportions of an immense industry in California, is beginning to interest hundreds of farmers in the San Joaquin Valley.

The Eucalyptus Forestry Company, which was incorporated recently in Fresno, has secured 320 acres of land at Alila and has already begun the work of planting it to eucalyptus trees.

Sonoma county papers say that in number and elegance of the designs, in beauty of decoration, in the size of the individual exhibits and in the beauty of the golden fruits, the last Cloverdale Citrus Fair, will go down in history as the most successful exhibit ever held.

Dr. Somers reports to the Board of Supervisors of San Benito county, that he had made exhaustive tests of reported cases of glanders in Hollister, and had also submitted the matter to Prof. Ware of the State University. The disease was a mild form of lympangitis and not glanders.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Minorcas, Liver Complaint.

I wish to ask Mrs. Basley if she can give me a remedy for my hens. I have a fine flock of Minorcas, have lost three or four this winter. At first they lose their appetite, walk around in a careless, dignified manner, will eat little or nothing, combs turn black, then die.?

Hoping to see a remedy if there may be any soon in your columns, and thanking you in advance.—J. C. J.

Some strains seem to be subject to this trouble. I have even known their bones to turn black and on holding a post-mortem examination, discovered the liver to be black and the egg organs also. I decided that it is liver complaint, congestion or inflamation of the liver. Dr. Salmon says that the cause of this is lack of exercise combined with over feeding; also from the birds taking tainted or moldy food, or poisonous substances into their digestive organs.

He recommends half a grain of calomel, followed by 20 grains of Epsom salts and 2 grains of bi-carbonate of soda after twelve hours. When improvement is shown give green food, tonics and raw beef."

I would strongly advise you to be careful what beef scraps you are feeding, bad, spoiled, or moldy beef scraps or meat meal is poisonous.

Pruning Walnuts.

How soon will it be safe to prune walnuts?—H. S. T. Lordsburg.

If there is but light pruning to be done on the walnut trees, they can be pruned at any time before the buds start, but if any large limbs are to be taken off it should be done in January or early in February before the sap begins to flow.

The flow of sap from the cuts does not damage the tree unless it should be pruned excessively, and in fact some loss of sap is at times an advantage as it retards leafing, and in that way the tree may escape damage by frost, or may make the tree leaf out late enough to escape some of the early blight.

The only objection to pruning after the buds have started is that new growth is broken off, where it should not be unless great care is taken in removing the pruning.

Molt and Trap Nests.

Since taking your paper I saw in an article a reference to a former article which I should very much like to have read. This former article was on how to make one's hens moult in the summer, so that the birds would be ready for steady laying in December. Could you tell me what issue this was in, and whether I could now get that issue, or could you tell me where I could get that same information?

I should also like to know if trap-nests are a patent affair which a handy man should not attempt to make on account of that patent?

I understand that your paper is open to questions that puzzle your readers.—A. K. T., Imperial.

The article to which you refer is "Dress-making in the poultry yard;" it is in the "Cultivator" of July 12th, 1906 I think you you can get it by sending stamps to this office. Some trap-nests are patented, but the nests made by Mr. Gowell of the Maine Experiment Station are not, and can be made by a handy man or any woman in half an hour. Plans of these have been repeatedly given in the Cultivator.—Mrs. A. B.

Liquid Manure.

Last week I asked you to print a question in this week's Cultivator. Today in looking over a back number I see that to have a question answered we must sign our names. I will ask the same question now.

Can young tomatoes and cucumber plants be forced to grow and bear earlier fruit by applying liquid manure, (made by pouring boiling water on cow and horse manure) at frequent intervals; or will it injury the plants? I have tried it a number of times on flowers, such as violets, pansies, etc. The "diet" seemed to do them lots of good as I had earlier and handsomer blossoms than my neighbors.—"Subscriber," Kern.

There are few plants that would not be materially helped by the treatment you describe, but care should be taken to have the liquid weak and apply it little and often, rather than seldom, and of dangerous strength.

To Toughen Hoofs.

Will you give me a formula for making a good hoof ointment to make the hoof grow and toughen brittle hoofs? Every rancher needs such an ointment in this dry country.

I take a great delight in reading the Cultivator and keep all the numbers for future reference. There is a great deal of good information to be gathered from them. Thanking you for your favor, and wishing you every success.—"Choctaw," Santa Paula.

Make an oil by using, cotton seed oil one quart, Creolin, 2 ounces, lamp black, one ounce. Mix and apply with a bunch of rags tied on a stick. Use freely inside, as well as on the outside of the hoof.—M. E. S.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

By Mrs. A. Basley, Hollywood, Cal.

HOPPER FEEDING.

TWO weeks ago the description of "hoppers" and how to make them was our theme. Today the subject will be the rations to fill the hoppers.

"Hopper-feeding" is getting to be quite the fashion and some people seem to think there is magic in the words and that so long as the food is fed in a hopper, no matter what that food may be, they are sure of success. One lady writes me "I am hopper-feeding corn, wheat, barley and oats. Another is feeding rolled barley, wheat and Egyptian corn also in hoppers, before the fowls all the time.

Variety of Food Needed.

One writes "I know your rules for egg production comfort, exercise and proper food, and I would like to know how to combine excercise with hopper feeding, for if I remember rightly you advocate feeding all the whole grain in the scratching pen so that the hens will have to exercise to get it, what should hoppers contain?"

What should the hoppers contain is a very important question. Poultry breeders differ just as doctors differ but the progressive and up-to-date breeders all admit that a variety of foods brings the best results, and that variety should be composed of grains, or their bi-products, green food and animal food.

Having decided upon this, let us see how the balanced rations can best be fed in hoppers as that is the way we wish to feed. The ration must contain the elements necessary to keep the birds in good condition, and also what is needed to make eggs. The food in the hopper may be just what we would use in the mash were we feeding that once a day.

I will give you a number of formulas of rations, any of which may be used advantageously in the hopper. These rations are used by such well known poultry men as Dr. Nottage, Dr. Sanborn and Mr. P. R. Parks; I will also give you some recommended by Professor Jaffa in his most helpful bulletin on "Poultry Feeding" (Farmer's bulletin 164.) besides the formulas that I have used and am now using, and I am never without plenty of eggs even when eggs are at their highest price.

What Dr. Nottage Feeds.

Dr. Nottage may, I think, be considered as the father of the hopper method, for he was the first to advocate it and was many years ago called "the man who feeds his hens twice a week" on account of using this plan. He commenced feeding the dry food as soon as the chicks were hatched, then as they grew and were weaned from the brooders and placed in colony houses on free range, he fed them from the hoppers placed near the colony house and near water, these hoppers he filled whenever they needed it with a mixture of cracked corn and wheat, keeping another box or hopper full of beef scrap and ground bone.

This he keeps before the fowls all the time they are on grass run, when however they are moved into winter quarters, as he lives in a cold climate and yards his fowls for the winter, he puts a hopper into the yard for a few days and notes the amount of grain they eat per day, this amount of grain, corn wheat and oats is fed in the litter of these cratching pen at four o'clock each day, and only the meat scraps are kept in the hopper. Green food, cabbage or sugar beets are fed at noon and no mashes at all. This is Dr. Nottage's plan and he has had good success with it. You note that he makes his fowls exercise in the scratching pen when they are not on free range.

Dr. Sanborn's Recommendations.

Dr. Sanborn tried the dry feed method very thorcughly for fifteen years before recommending it to others. He wanted to be quite sure and he realized that it takes time, study and patience to gain experience.

His formula for hens in the winter is: bran two measures; corn meal two measures; finely ground clover hay two measures; meat meal one measure. A cabbage, beet or some vegetable of that kind is supplied daily. In summer when the hens have free grass range his hoppers are filled with bran two measures; middlings one measure; corn meal one measure; meat meal one measure. This dry feed is before the birds at all times and will give a fine summer record along egg line.

The Parks and Basley Formulas.

Mr. P. R. Parks' formula is equal weights of corn, wheat, oats and barley ground as fine as flour, if we can induce the miller to grind it so fine and the beef scraps are kept separate and before them all the time.

My formula is very simple and has proved successful in this climate for years: One measure cornmeal; one measure alfalfa meal; one measure beef scraps and two measures of bran. In the breeding season I add one measure of rolled oats and if I find the hens are becoming too fat I lessen the corn meal. My hens being "bred to lay" like most of the American breeds fatten very easily and I watch for that, for I want eggs and not fat hens.

One has to use judgment in feeding hens as well as children. Formerly I mixed all the feed except the beef scraps and those I kept in a another hopper, but when I was away from home the ground grain hopper went empty and the hens were reduced to eating beef scraps instead, which affected their bowels. I really prefer keeping the beef scraps or the granulated milk seperate, because when I have plenty of skim milk to give the fowls they will eat very little beef scraps, also if on free range and there happens to be plenty of insect life they will not take so much of the beef scrap, whilst if it is mixed in the rations they are obliged to take it.

How to Balance Rations.

If too much meat is being fed, the fowl's droppings will be frothy, brown or yellow. In that case if you wish to continue such diet to force the egg yield give charcoal, ground in the feed, so that they have to eat it and add a little Nux vomica (to strengthen the digestion) to the water. One thing about this dry feed method, if the hens are fed finely ground feed and if it is rightly balanced they will not become too fat. But some of the breeds if fed whole grain in the hoppers, so that they do not have to excercise for it, will put on fat instead of producing eggs.

We have to watch our hens for that; when I was in the egg business I had one yard that I kept for hens with a tendency to plethora, I was trap nesting my hens and so had the opportunity of hefting the hens almost every day; if I found one hen that was beginning to get too fat I put her into a pen that was deprived of corn and had an extra allowance of alfalfa meal. Whilst in another pen were the biddies that needed a more carbonaceous diet. This was one of the secrets of my big egg record, one of the means of getting "bred-to-lay" hens.

Leghorns or all Mediterraneans do well on a generous corn diet whilst Rocks and Wyandottes require a narrower ration, less corn and more meat. To be really successful you should watch the fowl's growth weight and the amount of fat on their bodies and adapt the feed accordingly.

The Jaffa Rations.

Now about Professor Jaffa's rations. He has written and compiled one of the best bulletins ever put before poultry breeders, on poultry feeding. In it he gives the analysis of all the available feed stuffs on the Pacific Coast, he gives eight formulas for rations, and explains how by using the tables with the analysis of grains etc. that each person can balance the rations with the food that is cheapest in his own part of the country. More than that he gives the analysis of nearly all the proprietary foods used in California. It is simply an invaluable book for the poultry breeder. Write to the Director of the Agricultural Station (University of California, Berkeley, Cal.) and ask him to please send you (free) "Bulletin 164 on Poultry Feeding."

CARE OF BREEDING STOCK.

At this season of the year extra care should be taken of the breeding stock that we may get strong fertile eggs. Should your breeders be mated up in a weak and debilitated condition, the result will be far from satisfactory. For should the eggs prove fertile, the germ will not be strong enough to hatch, or if it does, it will not have vitality enough to develop into a strong healthy bird. In order to get results, we should give our breeders the best possible attention.

Selecting Breeders.

In mating up our yards, we should eliminate all birds that are not fully developed, and put in only strong healthy birds. We never believe in breeding a bird that has had a severe case of roupe. It is a good plan in most breeds to mate cocks with pullets and cockerels with hens if we would obtain best results. We have mated cockerels to pullets, and know of other breeders that practice this with good results, but as a rule, the best results are obtained by following the old plan of cocks and pullets, cockerels and hens.

After we have our yards mated, we should see that they are free from lice—should be provided with a good dust bath. If this is done at the beginning, and the houses are sprayed once a week with a good kerosene emulsion, we need not worry much about lice and mites.

Scratching Sheds.

All well regulated poultry yards should have a scratching shed, which at this season of the year, should be under cover, and if it can have a floor in it, all the better, the straw in this should be changed as often as it becomes foul.

After the rain season is over, the shed can be put out in the yard, but the straw or litter should be changed as often as it becomes damp.

Food for Breeder.

A good food for breeders is to give them for the morning meal a mash of some well balanced ration, and care should be taken not to feed them more than will be cleaned up in twenty to thirty minutes. After the morning meal has been cleaned up well, throw into the straw in the scratching shed, (which should cover the floor to the depth of six inches) a few hands full of some good scratching food, this will keep them busy till the noon hour, when they may be fed a "short ration," consisting of a mash, made of beef scraps, or cut bone, bran, alfalfa, clover, or lawn clippings. Then again in the afternoon, throw some grain in the scratching shed that they may be kept busy till time for the evening meal, which should be of whole grain, consisting of wheat, kaffir corn and cracked corn. Care should be taken not to get the birds over-fat, or to feed them more than they will eat up clean, for then they will refuse to work in the litter.

Green Food.

Green food should be provided, and fed at least once a day. This can be done by sowing alfalfa or rye either in a small yard, which can be cut and given them, or if you have range, the flock can be turned on it for an hour or two each day. When several pens are kept, and you wish to turn all on the range, after you have them yarded long enough to get them thoroughly acquainted with their quarters, small openings can be made for the females to go out from all yards, care be taken that the male birds do not get out. The hens will always return to their own pens. In this way you have advantage of the range, without being troubled with the male birds fighting. But the males should always have extra grain food provided and fed in the pens. Sometimes it is best to fasten a small box or cup up in each pen for the male to eat out of; care should be taken to get it high enough to keep the hens from eating the grain. Most male birds eat very little while the hens are eating, and unless some precaution is taken, they will get very thin. This is almost a necessity with birds with large wattles such as Mediteraneans. Should we feed enough to satisfy the males, there is danger in getting the females too fat.

Keep plenty of fresh water, grit and shell before them. Provide shade in warm weather. Keep them gentle and contented, and you will not be disappointed in the results.—Frank H. Thomas.

TURKEYS FATTENED IN PENS.

The possibilities of profitably feeding turkeys in confinement and improving the quality of the flesh was tested at the Utah experimental station, with a lot of six nearly mature birds, kept in a small pen with an open front closed by a curtain. Whole wheat was scattered in straw litter in the morning, corn was fed at noon, and a grain mash at night. The turkeys were also given skimmed milk, sugar beets and alfalfa leaves, with grit or gravel. One of the turkeys was sold at the end of three weeks, the others were fed for four weeks.

Considering the test as a whole, the six turkeps made a total gain of 16.4 pounds, of which 13.2 pounds was made by four birds. When bled and plucked the turkeys lost 7 per cent. in weight. The author calculated that there was a profit of $3.45 on an original investment of $8.50. "As to the quality of meat, those who ate it reported that they never ate better turkeys. There was no question about the quality of the meat being greatly improved. The two smaller turkeys were not in as good condition as the others, but the meat was excellent." This experiment shows two things: First, that young turkeys may be taken from the farm and fed in small pens at a profit; second, that the quality of the meat is greatly improved by such feeding.

It is well for the poultry raiser to keep a close watch of the legs of his fowls. If more would do this the poultry would be saved attacks of the insects that burrow under the scales on the legs and produce what we call "scaly legs." Often the trouble is not realized till the pest has spread all through the poultry yards and most of the fowls are affected. Then some of them have become so bad that it is extremely difficult to cure them. If they are taken in time a good bath of the legs in a kerosene emulsion or some other insecticide may check the invasion, as the insects will be annihilated. If the legs are as they should be they will be smooth and glossy in appearance, no matter what their color may be.

A shipment of peach trees from New Haven, Mo., to Hanford has been declared infected with peach root borer. The purchaser was reimbursed by the shipper.

THOROUGHBRED *S. C. White Leghorns*

They are vigorous and healthy and great producers of large white eggs. They have good size, rich yellow legs and bills. Eggs from special mated pens, $1 per 15, $5 per 100

KEEPING EGGS.

I was interested in reading the report of the man who had packed 300 dozen eggs in Water Glass, and was disappointed in results. My experience with 150 dozen was different, but still worse. In 1905 I packed 60 dozen and was so well pleased that in 1906, I filled the two stone jars and two kegs that were used before, after washing them well, and a small barrel which had been used for brandy originally and for two years had had salt in it. The vessels were clean, the eggs were fresh, and every layer of eggs at once covered with the solution of Silicate of Soda, as per formula: One part to ten of water, but the results were different.

In the first year there was a thick scum on top of the water but the rest was free, and the shells clean and natural as when put in and the eggs all right in every way. In the last year all the eggs were covered with a slimy jelly-like deposit, which when they touched the wood, (the inside and bottom of kegs and barrel) formed an insoluble cement so that the shells had to be broken to get the eggs out. They were discolored, and rings of lime or soda around them where they set in the liquid a day or so before the layer was filled out.

I got the stuff from the "Owl Drug Company,' of Los Angeles the first year, and from them at San Francisco the second year, ordered and billed as Silicate of Soda each time, but in neither case as thick as you describe, it was about like the thin grades of syrup that are sold. The heat and coolness were about the same each year, and the eggs were kept in the same place, the tank house, which is the coolest place we have in summer. My well water is a little alkaline, but so far as I remember was the same as used the first year. It goes without saying, that I want no more of that stuff, unless I can find out what was the cause of the failure and remedy it.

I have packed eggs in lime and salt with good results. You spoke of what read like a mixture of lime water and salt brine being good, will you please give exact formula?—W. B. C., Ceres, Cal.

A Book Worth Having.

The large 124-page catalogue and three poultry lectures that are being given away by the McClanahan Incubator company, 709 So. Main street, Los Angeles, are worth asking for. The book contains 250 photographs of scenes that are of interest to every one who raises chickens for pleasure or profit. It is certainly inspiring reading.

The three lectures are different from anything offered by any other company. They give full details of every feature of poultry raising from the selection of the eggs to the care of the chicks.

The "Success" Brooder, both hot air and hot water, are also made by this firm and are meeting with a large sale. Description and prices of both incubator and brooder, together with the lectures and catalogue will be sent free to all who write for them. You should send in your name and address today. We would appreciate it if you will mention this paper.

Among the exclusive breeders of Southern California White Leghorns using the columns of the Cultivator is Mr. Frank E. Baldwin of San José. Mr. Baldwin is one among the new breeders of this famous strain, having come from Colorado a few years ago. He has given his entire attention to the breeding of Leghorns and has a model yard, introducing many new ideas in housing his flocks, and has produced many prize winners. His new catalogue gives the pedigree of the birds in each yard and is very neatly gotten up.

DOUBTFUL IMPROVEMENT.

"I must say that Josh's education has improved him," said Farmer Corntossel.

"Did you ask him to help you on the farm like you said you would?"

"Yes."

"And he consented?"

"No. But he was so polite in his way of refusin' that I felt real flattered."

What a Bare Spot Means

Watch closely for the first indication of lice on cattle. Don't wait till they are infested, and rub themselves bare in their misery. The wisest course is to dust Instant Louse Killer *into* the hair along the back, and at base of tail and horns, **whether you see signs of lice or not.** If there is a louse on the animal this powder will kill it.

Instant Louse Killer

does it's work thoroughly—kills lice on poultry, horses, cattle, ticks on sheep, bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. It is also a standard disinfectant and deodorizer. **Guaranteed.** Comes in shaker-top cans, and being a powder, may be used in cold weather as readily as in hot weather. Look for the word **"INSTANT"** on can, as there are many imitations.

1 lb. 35 cts. 3 lbs. 85 cts.

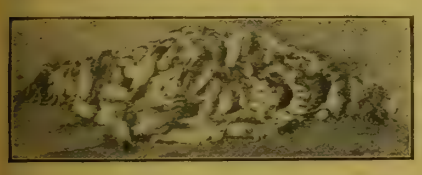
Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us. Anyway send for circular with affidavit of above killing, and a few out of many testimonials.

713 Waterloo St., Los Angeles, Cal.

TEST THE EGGS.

On the sixth or seventh day the eggs should be tested for fertility. This is a very simple thing. Take the egg to be examined between the thumb and forefinger, encircling it lengthways. and hold it between the eye and a bright jet of flame, such as a candle, lamp, or gas jet. If it is quite clear, it may be at once thown out, but if opaque, or nearly so, it is fertile. If the germ has died, the contents will appear uniformly muddy, and the egg may be thrown out. If any are doubtful they may be put back in the nest for two or perhaps three days, and re-examined. If no change to a very dark or opaque shade has taken place the egg is in all probability addled, and therefore useless.

If an egg should happen to be broken in the nest, the latter must be thoroughly cleaned out, perhaps a little fresh earth sprinkled over it, and re-lined with fresh hay. Some of the other eggs will probably have been splashed with the contents and these must be sponged clean with tepid water, dried, and returned to the nest, otherwise the pores of the shell would be badly closed up and the chicken inside might perish for want of the air which ought to percolate through.

A setting hen requires but one good feed a day, and that should be good, hard grain of some kind or other. Corn is as good as any, and perhaps barley comes next.

The hen should be fed about the same time every day, allowing her to be off the nest a shorter time during cold weather than during mild weather. Ten minutes during cold and twenty during warm weather are not excessive intervals. If the weather is very cold while the hen is off feeding, the eggs in the nest may be covered with a peice of flannel.

It is better not to give the setter any liquid until she has finished her allowance of grain. Many hens, if they can get to the water first, swallow so much of it that they do not care about eating afterwards. A hen which seems to have quite gone off her feed must be tempted to eat somehow, or her natural heat will go down and the hatch be a poor one. Soft food may be given, half oatmeal and half cornmeal, but as soon as her appetite returns she should be put on a diet of hard grain. A dust bath should be available for the setting hen each day, when she is off during feeding time. When several setting hens are off the nest at the same time there is apt to be some quarreling and fighting over the food, and this should be prevented. A very quarrelsome hen should be fed by herself. No green food should be given to setting hens, as this relaxes the bowels, but a supply of hard grit should be within reach although they will not likely use much of it. Before returning to the nest, take out some of the eggs, or she may break some by treading on them, placing them beneath her when she has —W. R. Gilbert, in Journal of Agriculture.

A Reliable Firm.

O give endorsement of a business house to Cultivator readers, menas that we are convinced that any business with which you favor it will be rewarded by courteous treatment.

Such recommendation can be given for the Newell Mathews Company of Los Angeles. This firm began business in 1886, incorporated in 1899, and the business has constantly increased from year to year. The company is the Southern California agent for the celebrated Studebaker vehicles, Oliver chilled plow, Emerson disc plow, Gem hay press, Thompson buggies, together with a complete line of recognized farming, orchard and garden tools.

It has been the policy of this firm to carry only such goods as have been thoroughly tested and found satisfactory in every respect. A large catalogue, filled with illustrations of everything used by the farmer, the orchardist and the gardener, will be sent free to all who write for it mentioning that the firm was recommended by this paper.

WANTED—TURKEY EGGS FOR SETTING. Also to buy a 240-egg incubator. Address BOX 155, R. F. D. No. 1, Whittier, California.

WATERMELON SEED.

FOR SALE—FINE RED CHILLEAN WATER Melon seeds. Price 50c a pound. WILLIAM BRITTON, Burbank, California.

When writing advertisers mention Cultivator

1907 STATE FAIR.

The next State Fair gives promise at present of being one of the greatest exhibitions held in California since the Midwinter Fair.

The National Irrigation Congress of two or three thousand delegates from all over the United States will meet in Sacramento at the time of the Fair, and many of the States represented will send exhibits of their products, which of themselves will make an extensive and very attractive feature. At present there is talk of enlarging the name as well as the scope of the Fair and call it say, "The California Agricultural and Inter-State Irrigated Products Exposition."

The opportunity for California counties to assemble and show their products will be the best they have had for a long time, and it is anticipated that every section and every product of the State will be liberally represented, while every effort will be put forth to make the poultry and livestock departments the biggest and most attractive ever seen on the Coast.

Chicken Sense.

The Cultivator is in receipt of a very neat booklet, issued by Agricultural Chemical Works of Los Angeles, Cal., containing 48 pages of valuable information to the poultry raiser. It gives information on artificial incubators, Poultry health and hygiene. A chapter on fattening for market. Cause and treatment of different diseases of poultry. The proper food for the chick, the laying hen, an egg record, and other information that will tend to help the poultry raiser, whether he be a large or small breeder. The booklet should be in the hands of every one, and will be mailed free if you write to Agricultural Chemical Works, and tell them you saw it in the Cultivator.

The Leedham Bulb Co. of Santa Cruz, California, is offering through the columns of the Cultivator their new catalogue and price list, containing a large assortment of their products, which ought to be of special interest to all lovers of flowers.

The demand for stone fruits in Central California is brisk and a great many trees are being planted.

California Horticulturally

By JOHN ISAAC, Sacramento, California

ORCHARD PLANTING IN THE NORTH.

TREE planting is being vigorously rushed in the upper part of the state and every advantage is being taken of the fine days which have been sandwiched in between the storms. We are assured by many growers that there is nothing in fruit growing any more and yet people—and among them many of those who advise against it—are planting more orchard trees this season than ever. From all parts of the Sacramento and San Joaquin valley as well as from the Coast counties reports are received to the effect that trees are being imported this season in larger quantities than ever before known, and the stock of our local nurseries was long since exhausted. Certainly, with all its drawbacks, Californians still think the fruit business is a pretty good one.

COMMENDABLE PRECAUTIONS.

Kings county has adopted a stringent ordinance against the importation of rooted grape vines into that county from any section in which either the Anaheim disease of phylloxera is known to exist. The devastation wrought by these two troubles among the vineyards of the state, have led those sections which have not yet been attacked by them to take extraordinary precautions against them in the hope of keeping them out. Many shippers of vines [illegible] these precautions and argue that they are unnecessary, but the vineyardist is following a commendable policy in taking every precaution for his own protection.

NEW COUNTY COMMISSIONS.

Very many of the counties of this state, which have heretofore regarded County Horticultural Commissions as needless, and in some instances denounced them as a form of graft, are awaking to the necessity of availing themselves of the protection which they give. Several counties in which no such office has been recognized since the adoption of the law over a quarter of a century ago, have made appointments during the past few months and now Siskiyou and Tuolumne counties are moving in the same direction. It is evident that every fruit growing county is at last awakening to the fact that if they are going to grow fruit they must be on their guard against pests and diseases, and no better form of protection can be found than that given by the law organizing county horticultural commissions.

EXPERIMENTING WITH TOBACCO.

J. B. Stewart, a Government expert in tobacco culture, has been making investigations in some of the northern counties recently for the purpose of determining whether there is any soil in that section suitable for the growth of tobacco, and has given it as his opinion that there are considerable areas in which there is a possibility of growing a good quality of this plant. Experiments in tobacco growing have been carried on in California from its earliest settlement, but for some reason they have not been continued to a successful determination. It is not improbable that, within our great area of territory and with our wonderful variety of soil and climate, sections can be found in which this culture can be carried to commercial success and another source of agricultural wealth be added to those we already have. It is to be hoped that Mr. Stewart's efforts will be crowned with success.

REMEDY FOR OLIVE KNOT.

The olive knot has obtained a foothold in some of the Northern Californian olive orchards, and while it is not spreading rapidly, and is not very serious as yet, it is still causing much alarm among the growers. The European varieties appear to be most susceptible to its attacks, while the Mission olive, while not immune, is very resistant. This disease belongs to the pear blight group of disease in being of bacterial origin, and little can be done for it in the way of remedies. The best treatment in the case of young trees, is their removal and destruction. In the case of older, bearing trees, their lives may be extended for some time and a number of crops secured before they succumb to the disease, although, even in such cases, the best thing is to get rid of them, especially if they are in a position to infect other trees. If, however, it is desired to continue the tree, all knots should be removed with a sharp tool, and this tool should be thoroughly sterilized, a paste composed of slaked lime and sulphate of copper may be applied to the wound. We have known old olive trees to be materially aided by this remedy.

BORDEAUX SPRAYING.

From our present knowledge there is nothing to be gained by using the bordeaux mixture as a winter spray. If any winter spray is used it should be the lime sulphur solution, which acts both as a fungicide and insecticide. There is, however, considerable evidence to show that Bordeaux applied at the time that the blossoms are opening will do much toward the control of the apple and pear scab. This early spraying should not be neglected with pears, and it may prove profitable in the treatment of apple scab.

The powdery mildew was carefully observed in our Bordeaux experiments this year, but we could demonstrate no advantage from its use on this disease.

CHERRIES IN SOUTHERN CALIFORNIA.

The subject of cherries was discussed at the recent Farmers' Institute at Pasadena, and on this subject, all present were agreed that it did not pay to attempt to raise cherries in Southern California in the the valley districts. There are small areas in some of the mountain valleys where the cherry grows and bears to perfection with the exception of an occasional season when late frosts cut the crop down. One member of the meeting declared that he had tried to raise cherries in Pasadena and found that he could better devote the land to raising oranges and pay five dollars a pound for his cherries in the market. There is one good thing about the cherry in such districts. It does not leave any room for doubt as to how it will behave.

BIG APRICOT CROP.

It is not always safe to play the role of a prophet, yet it is tolerably safe at the present time to predict a good apricot crop the coming season. There was a light crop last year, which was the usual off-year, and we rarely have two poor years together. Then the cold season has so far kept the trees dormant that there is little fear that they will bud or blossom prematurely and the chances are therefore, that the fruit will set well and remain on the trees. At the present time the trees are well loaded with fruit buds, so that altogether the chances for a good apricot crop are favorable. Of course, there are many contingencies which may arise between now and the picking time which will reduce the crop, but as these are unknown and unforeseen they cannot count in our estimate of probabilities.

A Business Education.

Every young man or woman who is energetic understands that those having a good business training have a great advantage in life. Every one should have such an education in addition to their regular school training. It very often is the means of securing a good position on the start at a good salary and thus makes you more independent than where one has to start in without experience at a low salary.

The Pacific Coast Business College is offering through the columns of the Cultivator a course in business training in connection with their regular course which would pay any young man or woman to investigate.

Goat's milk should yield the strongest butter.

DEMAND FOR YOUNG PIGS.

Continued from page 215.

pigs are soon put off their food if it is left to sour under their noses. When weaned, three meals a day should be given, mixed to the consistency of thick cream. They should now have small, or what are called "pig potatoes," boiled and mashed, and added to the sharps. As they make their growth, a little corn meal may be added, but not much, as it is too heating for young pigs. Barley meal, peas and beans may also be given. Bran, because of its character of composition, cannot be considered as a wholly desirable food for porkers, and is best left out of the menu. Some breeders, following the dry feeding system, give a midday meal of crushed grain, or grain and peas mixed. Peas are, of course, a highly nitrogenous food. The one thing to keep in view is a steady "coming-on" condition in the pigs. There should be no backening whatever, nor need there be if they have a roomy, clean, well-littered sty, and are kept under healthy conditions, with regular feeding from the first.—Journal of Agriculture.

ALCOHOL FROM CORNCOBS.

The Department of Agriculture is developing a new industry in the production of alcohol from corncobs, which, it says, promises to be of much commercial value. Investigations are being made at Hoopeston, Ill., and have proved that the large quantities of corncobs which every year go to waste, can be made to produce alcohol in sufficient quantities to justify the erection of a distilling plant in connection with a corn cannery.

So far, the department has succeeded by simple methods of fermentation in getting a yield of eleven gallons of alcohol from a ton of green cob, and by similar methods in getting six gallons of alcohol from a ton of green cornstalks. A department official says that these tests show that there are 24 pounds of fermentable substance in a ton of green field cornstalks, which will yield about half of their weight in absolute alcohol. In round numbers, a ton of stalks will produce 100 pounds of alcohol or 200 pounds of proof spirits. As a gallon of alcohol weighs nearly seven pounds, there should be fifteen gallons in alcohol in a ton of stalks. The addition of the corn on the cob adds further to the possibilities of alcohol obtainable from a ton of cobs, and will have its influence in bringing the quantity to a greater figure.

BROOM CORN.

In comparison with many other farm crops of this country that of broom corn (Sorghum vulgare), is very small. The high prices that this product has occasionally-commanded, have caused many a farmer to undertake its cultivation without first counting the cost of production and inquiring into the causes governing the price paid for the brush. The ease with which the crop can be grown to harvesting condition and the fact that a fair crop is a third of a ton per acre make the industry apparently lucrative, even at the ordinary price.

The sudden increases in acreage when the price is high show that growers, influenced by the apparent prospect of large profits, are induced to plant extensively to this crop. It is not to be inferred from this that the amount of broom corn grown is the only factor governing the price.

The annual production is so small in comparison with that of the leading farm crops that the commodity offers an easy opportunity for speculation, which results in great fluctuation in prices.

The marked decrease in price which follows when the acreage planted is unusually large is due in a great degree to overproduction, but also to the production of brush of an inferior quality. Growers who plant large fields without an adequate knowledge of the broom-corn business and a thorough preparation for taking care of the crop are sure to produce a poor quality of brush.

The Association at Brawley has about 25 acres of tomatoes and several acres of cucumbers pledged for the coming season.

Citrus Deciduous Ornamental TREES Vines Palms Roses

And Every One True to Name

We Are Universal Providers for Orchards and Gardens

We do not confine ourselves to fruit trees alone, but grow also an immense assortment of ornamental trees and shrubs, climbing and trailing plants, palms for house decorations and outside planting, roses in tree and bush form.

APRICOTS

Write us for prices on Blenheim, Hemskirke, Royal and Tilton Apricots. The last named is one of the best canning, drying and shipping cots on the market today. Our stock of this later variety is exceptionally fine, and our prices will be sure to appeal to you.

PEACHES NECTARINES

Among the standards on hand still in quantities, we have Elbertas and Tuscan Clings, and other leading sorts in limited supply. Also a fine stock of Stanwick Nectarines, the leading variety, on which we are prepared to make special inducements.

APPLES AND PEARS.

The leading varieties are becoming depleted fast, but we still have the following standards in stock:—Gano, Jonathan, Smith's Cider, Yellow Newton Pippin, Lawver and Spitzenburg.

In Pears: Bartlett, Beurre Hardy, and Winter Bartlett.

CHERRIES.

We are still in the position to supply Bing, Black Tartarian, and Royal Ann Cherries, and are prepared to offer special inducements in quantities.

ALMONDS.

If you want any I. X. L., Drake Seedling, Ne Plus Ultra Nonpareil Almonds, we think we can make it worth your while to place your order with us.

Calimyrna Figs

Our Great Specialty

None genuine without our seal

GRAPEVINES

We can still furnish such leading wine grapes as Berger, Feher Zagos, Grenache, Sauvignon Vert and Trousseau, and in table and raisin varieties, Black Cornichon, Black Hamburg, Flame Tokay, Emperor, Thompson's Seedless. Also vines grafted on Phylloxera resistant roots and rooted Phylloxera resistant vines. Write for our complete surplus list.

CITRUS TREES.

If you want an assortment of varieties we can supply you with the leading kinds of Oranges, Lemons, Pomelos, Limes, Citrons, all grown in the great Thermal belt near Exeter, Tulare county.

OLIVES.

Our assortment of the leading oil and pickling varieties was never better. Our catalogue tells all about them.

BERRIES.

Mammoth and Loganberry plants. Extra fine well-rooted stock. The new Himalayan Giant Blackberry, introduced from Australia, is proving to be a great money getter in the San Joaquin Valley and the growers are enthusiastic over it. Stock limited. Price $10.00 per 100 for finely rooted tips.

ROSES.

We are still in the position to make up assortments of many of the leading and best sorts of roses. Let us send you a list of varieties still in stock.

BURBANK'S CREATIONS.

For the first time we are offering four of his latest and best creations, SANTA ROSA PLUM, RUTLAND PLUMCOT, PARADOX and ROYAL WALNUTS. Write for illustrated booklet telling all about them.

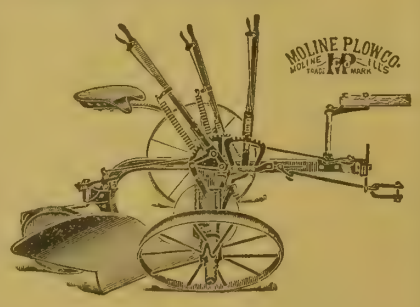
30,000 FARMERS Bought Good Enough Sulky Plows

last season. Since its introduction the sales on this tool have increased rapidly from year to year until last season it required, in round numbers, 30,000 to supply the demand. This ought to interest a man who is going to buy a plow. It means that after due consideration 30,000 farmers agreed that the Good Enough is

"THE BEST PLOW ON EARTH FOR THE MONEY"

A MOST DESIRABLE AND ECONOMICAL FEATURE IS THE EASE WITH WHICH BOTTOMS OF DIFFERENT SIZES CAN BE FITTED TO THE SAME BEAM.



The Good Enough is extremely simple. It has the desirable features of up-to-date and high priced sulky plows without the complicated construction of the very high lift type. The land axle has a yielding spring—uneven ground does not affect depth of furrow. **Turns square corners either right or left.** The landing lever and swinging clevis permit the operator to change the land of the plow instantly without stopping the team or leaving the seat. It is furnished with pole attachment when ordered. Made right and left hand. Sizes from 10 to 18 inches. Bottoms for every condition. Will plow any soil that can be plowed with a moldboard plow.

Wheels Have Removable Hub Boxes---DUST PROOF, OIL TIGHT

The Good Enough ALFALFA BOTTOM has no equal.
ASK YOUR DEALER TO SHOW YOU THE GOOD ENOUGH.

Send us your name and address, enclose four cents in stamps (to pay postage and mailing) and we will send you our

Flying Dutchman Song Book and Junior Plow Catalogue Combined

The rain record for the season in San Benito county stands at 10.07 inches, only a few showers having fallen during the week, amounting to .12 of an inch. Same date last season 7.18 inches.

The artesian wells at San Felipe are developing enormous supplies of water this season. In most of the wells the pressure is sufficient to drive the water into the second stories of houses.

Household Department

WHEN I AM DEAD.

When I am dead, if men can say
"He helped the world upon its way,
With all his faults of word or deed
Mankind did have some little need
Of what he gave"—then in my grave
No greater honor shall I crave.
If they can say—if they but can—
"He did his best, he played the man,
His ways were straight; his soul was clean;
His failings not unkind nor mean.
He loved his fellowmen, and tried
To help them"—I'll be satisfied.
But when I'm gone, if even one
Can weep because my life is done
And feel the world is something bare
Because I am no longer there;
Call me a knave, my life misspent—
No matter, I shall be content.—E. C. W.

WON AT WHIST.

THE steamer had but a couple of days more before reaching port when the sun, which we had not seen since our departure, broke through the clouds and bathed us all in a delicious warmth. Something else burst forth at the same time—the sunshine, for me, of a face. She came on deck for the first time, and her dignified father put her in a steamer chair, arranged her wraps and sat down beside her like a shepherd dog beside a lamb. Perhaps he saw me looking at her. At any rate, that's what I was doing, for I couldn't keep my eyes off her. Such refined dignity, such repose, such gentleness! it must have all come in generations of gentility.

Why had the weather kept her below till the voyage was nearly finished? I must make the most of the brief period left to secure an acquaintance. Alas, the sun went down in clouds, and so did my hopes! She did not appear on deck again. I did not even see her leave the ship.

Winter came and the usual round of gayeties. An invitation—bridge whist at Mrs. Peabody's—came, among others, for me, and I resolved to accept.

On entering the card room the first face I set eyes on was the steamer girl. I was surprised an though delighted at my luck in meeting her again, pained to see her in the company. Mrs. Peabody is ultra-fashionable, and the people she entertains are very "smart"—that is, the women drink cocktails, smoke cigarettes and gamble. If you ask why I go with such people, I reply I am a man and can go anywhere without oiling the feathers of my angelic masculine wings, but had I a wife she should not go to Mrs. Peabody's.

I at once sought an introduction to the steamer girl, Miss Delaplain, and soon saw that she was out of her element. When a cocktail was handed her she started and declined it. I caught Mrs. Peabody frowning at her as she did so with an expression which being interpreted meant, "You don't get invited here again." Several young bloods had been chatting with Miss Delaplain when I was introduced to her, and they must have been putting on their up-to-date society manners, for she looked ruffled, and when I addressed her deferentially she figuratively nestled to me as one would cling to a lifeboat.

Miss Delaplain and I were at first partners. I saw at once that she knew very little about the game, and I soon suspected she didn't know she was playing for money. When we changed partners her new vis-a-vis soon made her aware of her temerity in playing a game she did not understand. At every misplay he would scowl at her and did not scruple to indicate that he was wroth.

After the evening's amusement I was about to take my departure when I met Miss Delaplain wearing a countenance that told of trouble.

"What shall I do?" she said. "I have been told that my loss at bridge whist is $105. I had no idea I was playing for money."

"And my gain is exactly the same amount. Though I knew that we were playing for stakes, I do not fel at liberty to accept my winnings.'

"Why so?"

"You for one did not know that you were risking anything. The money you lost may have gone to me. You are in an unpleasant position. So am I. There is a way out for both. Let me turn in my winnings to cover your loss."

There was no trouble in persuading here to accept the terms, at least temporarily, for she had no money with her, and she told me she would need to break the matter to her father, who would be greatly shocked at hearing that she had been gambling. I bade her good night after asking permission to call and, going to the hostess, paid her loss.

Two days later upon opening my morning mail I found a note from Mrs. Peabody inclosing a note and a check for $108 from Mr. Delaplain in payment of his daughter's loss at bridge whist. Mrs. Peabody called my attention to the fact that the amount was $3 more than the loss. I supposed this to be an error until, referring to Mr. Delaplain's note, I saw in a postscript on the second page, "The $3 is to cover the supper."

What should I do with this amount? It did not belong to me and was intended as a snub for Mrs. Peabody. Should I returns it to her, calling her attention to the snub? Such a crime would preclude the possibility of my attending any more entertainments at her house. I thought the mater over and concluded to accept the consequences. I enclosed a check for the surplus amount with Mr. Delaplin's note, underscoring the postscript with a blue pencil.

A week later I met Mrs. Peabody face to face on the steps of St. James' church. She gave me the dead cut.

My decision was more than one re-

FOR THE

lating to Mrs. Peabody. It included the smart set of which Mrs. Peabody was a distinguished member. Something in the old fashioned demeanor of Miss Delaplain told me that if I adhered to the smart set I wouldn't be a fitting companion for her, and knew that after her first experience she would not get lost among them again. My withdrawal proved to be no loss to me, for in time I became engaged to Miss Delaplain. I was glad to be privileged to return in gifts the amount of my gain at the bridge whist, which I always claimed I had won from her. Besides the money, I won a wife.—Nathan White Howe.

YOUR BOY'S MANNERS.

Mothers make a mistake if they do not insist on good manners in the family. There is no reason why a boy should be boorish when his sister is polite, that a boy should be grumpy and awkward, ill at ease before strangers and unacquainted with table etiquette when his sister possesses the savior-faire of good breeding. We are talking about the growing boy. While he is still under your daily care, teach him to take off his hat when he meets you on the street, to rise when you enter the room, to place a footstool for his grandmother, and to carry any bundle or parcel not too heavy for small hands. A little fellow who is permitted to wear his hat in the house when only his mother and sisters are present cannot be expected to take it off because visitors have arrived.

"Freddie, why do you stand there with your hat on," asks the mother severely, when Freddie thus transgresses propriety, and the minister's wife or the lady from Baltimore or the aunt from Philadelphia is in the room. If Freddie had been taught always to stand bare-headed in the house, if it were his custom to pull off his hat whenever he met a lady or an older person of his own sex out-of-doors, the act would be automatic. Let your boy wait on you. Do not rush wildly to wait on him Let him button your shoes, put on and take off your rubbers, perform little services at home. If you are wise you will send him on errands to your friends, give him notes and messages to carry, and otherwise make him at ease when obliged to address some one he knows slightly.—Margaret E. Sangster in Woman's Home Companion for March.

Your Political Duty.

It is your duty, if you are of age and a man, to vote at all elections, and to inform yourself beforehand what measure and men you ought as a good citizen to support.

It is your duty to act generally with some political party, and to exert your influence upon its leaders to induce the nomination of capable and honest men for office. And it is your duty if your party nominates a bad man, to vote against him, and thus keep the public and general good before your eyes, and set an example of true public spirit before your fellows.

If you have political rights of which, even by your own will, you cannot divest yourself, and which are therefore properly called inalienable, so you have political duties which also you cannot justly neglect or lay aside.

It is your duty to watch the conduct of public officers, to see that they perform their duties and observe their constitutional limitations; and if they do not, then it is your duty to help to expose them, and at the elections to punish them. For it is only by such vigilance that a nation can preserve its liberties unimpaired

It is your duty as an American citizen to obey the laws, even if they are, in your belief, unjust or unwise. It is your right to expose the folly and injustice of a law, to demand its repeal, and to try to get a majority to repeal it.

It is your duty to insist upon the prompt execution of the laws; to be convenience, to aid in their enforcement, if you are called upon by proper officers; and to resent with indignation every sign of lawlessness and violence, and require its vigorous suppression.

It is your duty, if you are a voter and qualified to serve when called on, as a grand or petit juror; and this at even great inconvenience.

It is your duty to serve in the militia, if the law commands it; and every American voter ought to have a sufficient knowledge of the manual and use of arms to enable him to act efficiently if called out to help put down a riot.

These are your political duties, which you cannot neglect or abjure without disgrace to yourself and harm to the country.

CALIFORNIA'S WORLD'S FAIR, 1913

California is to have a World's or International Exposition in the year nineteen hundred and thirteen, in commemoration of the four hundredth anniversary of the discovery of the Pacific Ocean by Vasco Nunez Balboa and to celebrate the completion of the Panama Canal. This exposition is to be held in San Francisco, the metropolis of the Pacific Coast, and the men of affairs from different parts of the State, who have gotten back of the proposition, expect the people of California to make it the greatest fair ever held. Its greatness will not necessarily consist of the vast acreage covered by the fair itself, for it has been demonstrated that some of the recent expositions have undertaken to cover too much ground. In the Pacific Ocean Exposition it is contemplated to take advantage of the mistakes of others, and to render it unique, and so interesting that people will be attracted to it from all over the world.

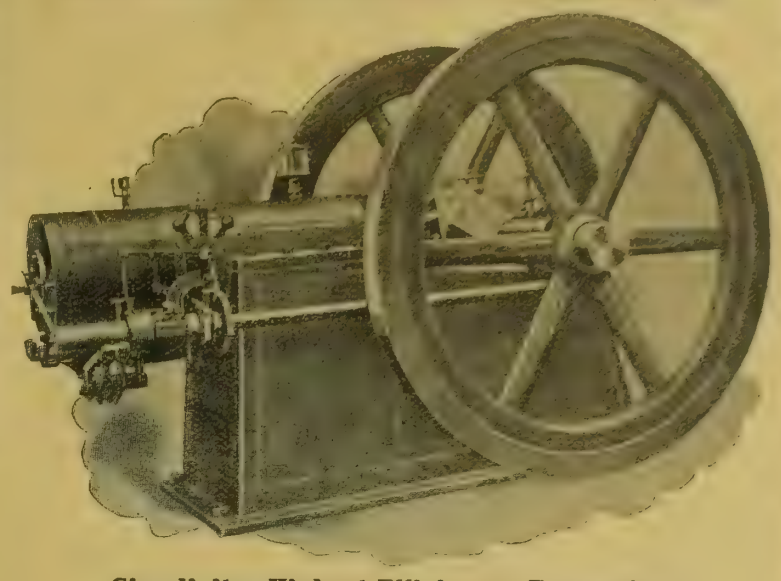
It is a matter of complete demonstration that the different expositions held in the United States have been of material advantage, not only to the nation as a whole, and the immediate localities where they have been held, but most particularly to the State in which the exposition was held. What has been demonstrated in other states will be fully realized in California, and, owing to the wonderful opportunities here, even better results may be safely anticipated to this State than those received by others. It is a foregone conclusion that most of the people drawn here by the exposition will take advantage of the opportunity of touring the State with the result that thousands will make their permanent homes here.

A movement has been started to build a wagon road from Milo to Lindsay, and the residents along the proposed route expect shortly to begin a canvas for funds with which to do the work.

There is a Reason why you should buy

Columbus Engines

Made by the Columbus Machine Co., Columbus, Ohio



Simplicity—Highest Efficiency—Economical
Highest Grade of Material—Best of Workmanship

They have been in the field over fourteen years.

Their output is one of the largest in the United States.

What does this mean? It means that the present standard they are maintaining on Columbus Engines is the result of fourteen years labor of experienced mechanics with one of the best equipped plants in the United States behind them, to produce an engine which is simplicity in itself.

Free from all complicated and trappy devices. It don't take an expert mechanic to see the simplicity and good points on the Columbus Engine over other makes.

It don't take an experienced mechanic to operate it. We carry complete stock at all times. Come in and let us show you.

Estimates given on complete pumping plants.

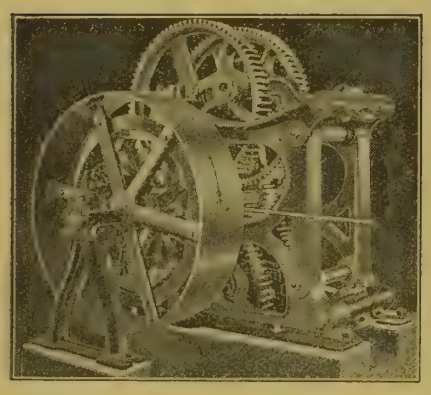
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Send for catalog.

Citrus Fruits

Seven or eight carloads of oranges arrived in addition to a liberal quantity by steamer from San Diego. The bulk of the recent large offerings has been in rather poor condition and with large sizes predominating. Owing to the general softness of the oranges now in market sound culls have been going at or about top prices. Lemons were unchanged and slow and there was hardly any demand for grapefruit.

Citrus Fruit Shipments.

LOS ANGELES, Feb. 26.—Monday, February 25 (Santa Fe only) 39 cars of oranges; 19 cars of lemons.

Total to date this season, 7379 cars of which 922 cars are lemons.

Total to same date last season 9065 cars of which 1036 were lemons.

High Priced Fertilizing.

Mr. C. W. Leffingwell, Jr., of East Whittier, one of California's most successful lemon growers, has probably bought the highest-grade fertilizer ever sold in California. Mr. Leffingwell purchased some fertilizer from the Agricultural Chemical Works of Los Angeles for $95.00 per ton. Mr. Leffingwell, with his usual ability to figure, sees that in high grade goods he saves handling and freight. This is surely an age of concentration.

EGGS Ringlet Barred Rocks $1.50 and $2.00 per sitting 15. Black Minorcas (Albert strain) $1.50, and $2.00 per sitting 15. Mammoth Pekin Ducks $1.00 and $1.50 per dozen.

EDWARD A. HALL, WATSONVILLE, CAL.

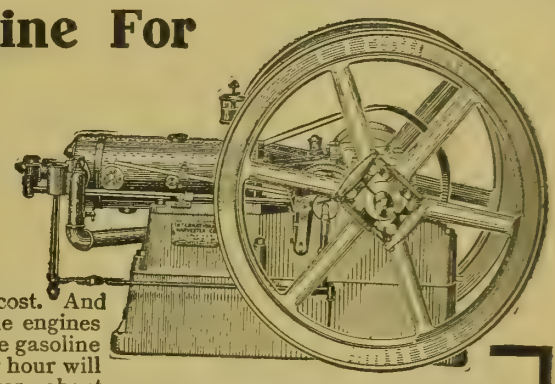
Get an Easily-Operated Engine For IRRIGATION PUMPING



WHEN you buy an engine for irrigation pumping you don't want to get one that will require an engineer to run. What you want is an engine that will practically run itself for hours at a time. One that is sure and safe and steady, one that is simple in construction, and easily understood and operated.

I. H. C. Gasoline Engines are that kind, and for that reason are especially adapted to pumping for irrigation. A small boy can look after an I. H. C. Engine, and run it as successfully and economically as anyone. Look it over once or twice is all that's necessary in a day's run.

Now, what else do you want in an engine for irrigation pumping?

Economy—To be sure, you want an engine that will pump the largest amount of water at a small cost. And here again I. H. C. gasoline engines fill the bill. Ordinary stove gasoline is the fuel, and the cost per hour will be about 1½c per horse power—about 45c a day for a three-horse power engine working 10 hours. That's cheap enough isn't it? And convenient. You can buy gasoline by the barrel, and always have plenty of fuel on hand.

Durability—Because I. H. C. engines are simple and strong in construction, they are durable, too. There's nothing much about them that can wear out. Repairs are small and inexpensive; parts can always be readily obtained, and you can replace them yourself.

Ease of Operation, Economy, Durability—these are three good points that help give I. H. C. gasoline engines a superiority over others.

If you are now using any other power, or if you are planning to pump for irrigation this year, go to our local agent and examine these famous engines. They are made in various styles (Vertical and Horizontal, Stationary and Portable) and in sizes ranging from 2 to 20-horse power. During the seasons when not in use for pumping they can be made to serve in a hundred other ways.

Call on our Local Agent or write nearest general agency for illustrated catalogue.

The Twentieth Century Pumping Plant

A High Grade, Modern Equipment for Raising Water in Large Volume in Which Simplicity, Efficiency and Economy Form a Perfect Trinity

Courtesy WESTERN GAS ENGINE COMPANY

THE SANTA ANA VALLEY IRRIGATION COMPANY claims to have one of the most economic, powerful, and altogether satisfactory pumping plants ever installed in Southern California, which runs as smoothly as a watch while raising 400 miners inches of water a minute.

It is stationed on the Santa Ana river twelve miles up the stream from the little city of Orange and anyone visiting that section will be cheerfully shown over the entire plant, for the company show a pardonable pride in calling attention to the fact that they have a beautiful and perfect piece of mechanism, that ticks away with the unswerving regularity of a pendulum, in the fine 60-horse-power gas engine that lifts the water.

The water supply is furnished by five 12-inch wells in a line, each 80 feet deep and 75 feet apart. Each is connected with the others by a 10-inch suction pipe attached to an 8-inch pipe in the respective wells, so that the water is pumped simultaneously from all the wells.

This pipe is in a tunnel or trench 8 feet wide and 29 feet deep and the wells are so piped that the water may rise the full height of the tunnel. Before the pumping begins the water is at least eight feet above the pipe during the driest part of the year. The tunnel is lined with close fitting plank, to preclude the entrance of sand, and is strongly and firmly braced.

At one time during October last, the pump was run continuously for 36 hours and the water in the trench was diminished only ten feet and the Board of Directors are enthusiastic at the unmistakable success of their enterprise. They feel that they are always assured of an abundance of water for their great ditch, which furnishes water for the irrigation of about 17,000 acres in and about Orange, Santa Ana and Tustin and are more than satisfied that the $10,000 spent for the installation of the plant has been their most remunerative investment.

It is noteworthy that the entire plant is the product of California industry.

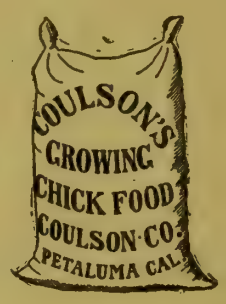
Coulson's Growing Chick Food



Coulson's Growing Chick Food is a balanced ration of cracked grains, seeds, mill feeds, meat and bone meals, carefully mixed according to a formula which has been compiled only after much experimenting.

It contains everything that a young chick requires up to three months old, and can be fed either from the commencement, or to gradually supersede **Coulson's Special Dry Chick Food**, say four to six weeks old.

Flock of three-months-old pullets fed on **Coulson's Special Dry Chick Food**, and afterwards on **Coulson's Growing Chick Food.**

It can be fed until the chickens are three months old, when you can commence feeding **Coulson's Improved Mash Egg Food.**

When making the change from **Coulson's Special Dry Chick Food** to the **Growing Chick Food**, it will be found best to do so gradually, changing one meal at a time.

If you will feed **Coulson's Growing Chick Food** to the chicks they will be fully nourished, and they will enjoy their feed. In consequence they will grow rapidly, and mature quickly.

ASK YOUR DEALER FOR IT.

One of Our Numerous Testimonials

"I tried **Coulson's Growing Chick Food** exclusively the first year in the business, on Brown Leghorns. Sold the cockerels as broilers at 9 weeks old, weighing 2 pounds, 3 ounces each.

"I tried my own mixture of food the next year, and took the same care of the chicks, as near as I knew how; and sold 75 cockerels as broilers, weighing 1¼ pounds each at same age.

"Having tested at my own expense the two methods, I have concluded the **COULSON FOOD** is superior."

Bacteria in the California Home

Suggestions as to the Best Ways and Means of Preventing the Development of Those Antagonistic to Human Life

By MINNA E. SHERMAN, Fresno, Cal.

THE majority of these minute members of our households are good and indifferent, while a few only are very bad. The good bacteria are useful friends, the bad ones are enemies that must be controlled, while with the indifferent ones we are not concerned. The science of housekeeping consists in keeping at a minimum the bacteria that are dangerous to health.

The Troublesome Bacteria.

While it may be less pleasant, still it is best to consider the bad or troublesome bacteria first, to impress on the mind how really dangerous they are to health. The mother is usually the nurse at the bedside of loved ones, even in these sad hours it is a relief to the burdened heart if the disease has not been brought into the house by carelessness or neglect of sanitary laws. That bacteria causes many diseases we postively know, for we can test the matter by cultivating the bacteria under suitable conditions of warmth, in boullion or starchy compounds and then by injeting a dilution of the culture into the veins of lower animals, produce the characteristic disease. It is not necessary to go further into cultures, interesting as they are to the student. We all know that when life ceases dampness, warmth and oxygen are present and decay set up; this is bacterial life. The bacteria live and die and in doing so set free the oxygen, hydrogen, nitrogen and carbon locked by life in the dead body; these elements set free are again used to keep other life processes in new individuals. The decay of animal and vegetable life therefore release the material and they are again available.

The alarms raised by the yellow journals of the great danger to life is not necessary, for man had lived many hundred years before he discovered that his body was the hot bed or conservatory for the lower forms of plant life, yet the careless ways of our ancestors with their cess pools, garbage dumps, and emptyings of sewage into running streams, has given us much needless suffering, for surely the sins of the father fall heavily upon the children in matters of sanitation.

The majority of bacteria are vegetable, the fact that some forms move rapidly in a drop of fluid puzzled the students for a time, and led to classifying them as animals. So minute are they, that of the common rod-shaped one, it requires 1500 laid end to end to scantily reach across the head of an ordinary pin. After all has been said there are no more poisonous bacteria living on the human tissues, than there are poisonous shrubs and trees; therefore if we can render our food free from them and make our bodies immune we have little to fear; for harmful bacteria grow at the expense of the body or material on which they find lodgement. It is the life and death of these tiny organisms that give rise at times to the ptomaines in food. The disease germs, as of typhoid fever, are called pathogenic germs; these are fortunately not common.

Purity and Cleanliness the Watchword.

It is only when the healthy rhythm of the body fails that troublesome bacteria set in, that are disastrous to us. In other words a healthy body is immune, it may have bacteria pass through it, of all sorts of diseases, but they find no suitable place to grow and so pass on without doing harm. Water is always considered as being easily made impure, indeed most of the city diseases are water born. The water of cities, except where furnished by deep wells, should be filtered by the city in a large way. If this is not done then the householder must take precautions. A small still on the kitchen stove will furnish enough water for drinking purposes. The small domestic filter used is not only useless, but often dangerous, as the breeding places of the very germs we are seeking to destroy.

The green scum seen on pools as sluggish water are a minute algae or water plant, they make the water ill-smelling and disgusting. Dr. Moore of the Agricultural Department at Washington found that copper sulphate destroyed these completely, without injuring the fish in the water or rendering the water unfit for domestic use. The amount of water in the pool is measured and copper sulphate at the rate of a 100,000 part of water contained is placed in canvas bags and dragged though the water, either from boats or from long poles. In a couple of hours the water is found by chemical analysis to show no copper and the algae have disappeared. Water is not often dangerous from the bacteria natural to it but is tainted by the wastes of animal life. It is the human beings that taint it with their bacterial diseases. Water has been known to carry typhoid fever germs for miles underground. In Switzerland cases were traced from one side of a mountain to the other, by an underground connection between two springs.

Look to the Water Supply.

In California the wells in the country districts are driven through a subsoil that contains alkali. a In a few years the casing becomes perforated and surface water drains into the well. When we moved on the ranch we discovered that the wells were in this condition, and my father studied out a way to make them proof against sur-

Mrs. Minna E. Sherman

face water. The wells were cemented in the following simple way, and after twenty years of use, we see no reason for changing them, as the water remains pure. An iron casing fifteen inches in diameter was driven down thirty feet until it had passed below all surface drainage. Inside of this casing came another one of six inches in diameter, driven down until water was reached.

The six inch casing was capped for the time, and the water between the two casings pumped out, then a hose two inches in diameter was used to sift cement down to the bottom. After twenty pounds of dry cement was in place around the six inch casing, a small weight was run around to settle it more firmly, then a smaller hose was introduced and twenty pounds of water was evenly spread on the cement. This was repeated until the surface was reached, then the well was left alone for a week. When the six inch casing was uncapped it was found a little cement had reached the inside and this was drilled out. The water has been tested from time to time and found to be pure. It took eight sacks of cement to cement this well, but as the well has never given us any trouble it has paid well. The well is 108 feet in depth, with water rising to within twelve feet of the surface.

People fear sewer gasses, yet they are a slight source of danger compared to water, as nearly all the bacteria of diseases or pathogenic germs require moisture to become active.

Eradication of Tuberculosis.

Tuberculosis, the great white plague, it is said could be stamped out in twenty years, if the people infected with it could be induced to carefully burn all the expectoration and excreta from the body.

The region around Mentone, France, was the healthiest in the world and patients even from the United States were sent there and returned cured. Now, even the rugged peasants are dying off with consumption. This bacillus resists dryness and remains alive for long periods. It is carried around to every part of the world in dust and only waits for moisture and warmth to start its life processes. It naturally finds these readily in the human body, on the moist lung surface, or in the food it infects the stomach and bowels.

The rooms that have been occupied by a consumptive should be fumigated and everything in them disinfected; the paper removed and the wood work repainted.

In New York City, the tenement districts showed certain spots that were marked black with death from consumption in the health charts. These the authorities ordered specially disinfected by removing the plastering and having it renewed and new paint put on the woodwork everywhere. At once the infection of new inmates ceased and the spots became white on the charts.

Typhoid fever is always the result of some one's carelessness in not disinfecting the discharges from a sick person, and while it comes in the water, it is always placed there by a previous case. Without the infection of a bacteria introduced in the stomach, there cannot be any typhoid, no matter how filthy the surroundings.

Sources of Contamination.

One great source of contamination is found in the house fly; it breeds in cesspools and manure heaps, and carries its bacteria on its feet. It alights on the moist warm food, and when that is eaten we have a grave source of danger. The house must be thoroughly screened to keep out flies. Cesspools and manure dumps must be made sterile by use of lime or kept dry by using earth over them.

The pets of a household bring disease; the house cat wanders into filth and yet is often placed upon the bed with the baby. Ringworm is said to be a cat or dog disease, rather than a human one, and that it is usually caught from the family pets. Glanders, anthrax and lumpy jaw has had its human victims.

Milk not Always Dangerous.

Milk is the food most censured, but that is because it is the easiest to attack. The dairyman is not rich, and he can easily be put out of business by a little well directed attack. The meat trusts have put the small butchers out of business and are too powerful to care for the attacks made on them by local health boards.

The milkman has often suffered from malicious persecutions, the newspapers joining in the cry, but when he has pushed the case to trial nothing has been proven to his detriment. The same newspapers have not come out in his vindication, they have merely put in a tiny note somewhere about it. The bacteria count means little, for often milk may have a 100,000 or 200,000 count, and if not one are pathogenic or disease germs be more wholesome than a milk with perhaps a hundred if one or two of these are the

Deciduous Fruit Culture

By J. W. MILLS

GRAPE CUTTINGS IN HEAVY SOILS.

THE planting season is now well underway in the various deciduous fruit growing sections and especially in the desert regions. Perhaps the majority of vineyards are planted from cuttings. This was especially true in the Imperial country previous to this time. It has been demonstrated, however, that the best results are obtained from plantng rooted vines. Several hundred acres are to be planted this season, and many of them will be with cuttings.

Avoid Over-Irrigation.

Last season we had occasion to visit several newly planted vineyards in the Imperial section, and on the light sandy soil, nearly one hundred per cent. of a stand was obtained from cuttings. On the heavier soils, a very poor stand was obtained, the difficulty in such cases being that too much water was used.

Fig cuttings planted ten inches deep were completely rotted off at the bottom and the tops protruding a few inches above the ground were dried out completely. Midway between the cuttings were green and in many cases sending out shoots and roots.

Cuttings should be completely buried in that climate and should not be over ten or twelve inches long. If the tops sticks out of the ground they will dry out before the roots can start, and most farmers will conclude that the plants need water when they see this, while in fact the soil is moist enough in most cases. Sometimes they are too wet when the tops are dried out, as shown by the fig cuttings referred to.

Proper Planting and Care.

By covering the cuttings entirely up and examining the soil occasionally and only irrigating often enough to keep the soil moist slightly in excess of what is ordinarily required for rooting cuttings, better results will be obtained on these heavy soils.

We appreciate the fact that it is folly to try and maintain a certain uniform condition of the soil as regards moisture in that country, and a slight excess is the only safe method to pursue, but it is not safe to be guided by the appearances of the upper end of the cuttings.

Water is almost always turned on when the tops of the cuttings show dryness, and unless they are on sandy soil that will permit the surplus water to drain off, or if the cuttings have not already struck root on the heavy clay lands, they receive a shock that will usually kill them. These vineyard problems are far from being worked out, some claiming that rooted vines die in about the same proportion as cuttings.

We are convinced in our own mind that this condition is due almost entirely to the improper use of water. Water is cheap there and easy to apply, and it is a great temptation to use it on the least provocation. The farmers have also labored under the uncertainty of supply owing to their water troubles, and many admit that they often used more than they should because they did not know when it would be shut off indefinitely. Under such conditions, proper methods are hard to follow.

Subsoiler Needed.

Land that is formed by deposits from overflow like those of the Imperial Valley, have layers of heavy and light soils, and it is hard for water to penetrate to a very great depth, unless these layers are broken up.

One farmer irrigated his vineyard every two weeks, running water between the rows of vines every eight feet, still his land will sub-irrigate forty feet on each side of his furrows, which is due to layers of clay beneath the surface.

It seems certain that where there are such layers within reach of the subsoiler, much good could be done by the use of this implement. By running the subsoiler to a depth of two feet, the irrigation water would begin immediately to spread from that point, and while the surface may be kept comparatively dry for a few irrigations, the water would be placed below in less time and at less expense than if it had to soak from the top down.

it is very clearly shown in a number of cases in the Imperial Valley that too much water is being used. Some of the best farmers informed us that they had proved it. They were dry-land, hot country farmers for years before they went there, and also had considerable experience in irrigating field crops.

The trouble has been that it was too easy to grow big crops with plenty of water and little cultivation. This worked all right for a few years, but there was a limit. More cultivation and less water has given the best results with field crops, and all the evidence goes to show that in vineyard practice, the same rule will hold good.

SULPHUR FOR MILDEW.

Every grape-grower should supply himself as early as possible with all the sulphur he will need during the season to control the Oidium or Vine Mildew in his vineyard. Many who neglected this precaution last year lost a considerable part of their crops by attacks of this disease.

Commence Work Early.

In most parts of California the Oidium can be easily controlled in the spring and early summer, and so completely eradicated from the vineyard at that time that there will be no danger later, during summer and the ripening period. Even where there is danger at all seasons, as in the cooler coast valleys the late control is much facilitated by prompt and thorough treatment during the spring

A proper sulphuring in April or May is far more effective and costs much less than one in July or August.

A bulletin on the Oidium and its control will be issued by the Agricultural Experiment Station shortly, in time for the first sulphuring, but, in the meanwhile, a few hints on the kind and amount of sulphur necessary may be useful.

Applications and Apparatus.

The amount of sulphur needed will depend on the locality and the method of application. We may reckon that on the average, in the drier parts of the interior one, in the cooler parts and the main coast valleys, two and within the influence of frequent summer ocean fogs three sulphurings will be needed. We must provide also for the possibility of having to repeat the first sulphuring in case the sulphur is washed off by rain or wind before it has done its work.

Those who are fortunate enough to possess suitable knapsack sulphuring machines will need less sulphur than those who are forced to use the usual method of distribution by means of preforated cans. Nearly everybody can, however, obtain a hand bellows, which are better and more economical than the cans.

The following table indicates approximately the amount of sulphur which

will be needed under various conditions:

Amount Needed for 500 Vines.

	Number of Sulphurings		
	One	Two	Three
Knapsack Machine.	10 lbs.	17.5 lbs.	30 lbs.
Hand Bellows	15 lbs.	30.0 lbs.	50 lbs.
Perforated Can.	20 lbs.	50.0 lbs.	100 lbs.

Allowance is made in this table for the cases where it is necessary to repeat the first sulphuring, in locations where two or three treatments are needed. These amounts, however, will be sufficient only if the work is done properly. One proper sulphuring is better than three imperfectly applied.

The best sulphur to use is that which is in the form of the finest powder. With good flowers of sulphur less than the amounts indicated above will be sufficient, with coarse ground sulphur more might be needed. The best sulphurs usually cost more per pound, but may be the least expensive, as they go farther and are more effective. The quality of the sulphur cannot, however, always be determined by the price, so that a few directions as to how to judge of the quality may be useful.

How to Know Good Sulphur.

1. The finer the sulphur, the more bulky. Therefore if several sulphurs are in sacks of equal weight, the largest sacks will contain the finest sulphur. A 110 pound sack of good flowers of sulphur is twice as large as a 110 pound sack of very coarse ground.

2. The color of sublimed sulphur is a clear, bright yellow. The color of ground sulphur will vary with the fineness. Coarsely ground sulphur is almost of the same color as sublimed. When finely ground the color becomes whitish. The whiter a ground sulphur, the finer it is, provided the color is not due to adulterants.

3. A good sublimed sulphur should feel as soft as flour when rubbed with the fingers in the palm of the hand. If hard particles are felt, the sulphur is not of the best quality. Ground sulphur always feels a little gritty, but the hard particles should not be large or numerous.

4. A very good idea of the fineness of sulphur can be obtained by the use of an ordinary good hand magnifying glass costing about one dollar. A magnification of 10 to 20 diameters is sufficient. With a little experience sublimed and ground sulphur can be distinguished by this means. The particles of sublimed sulphur are all nearly spherical with smooth outlines. Those of ground sulphur are irregular and with sharp edges.

The sulphur is most easily examined when spread on a piece of glass over a dark back ground. A good way to spread the sulphur is to place a small pinch on the glass, wet it with a few drops of ether and shake. This will distribute the sulphur in a thin layer over the glass and much facilitate the examination.

The Agricultural Experiment Station will gladly examine samples of sulphur sent by growers and report on their quality.—Frederic T. Bioletti.

OLIVES FROM CUTTINGS

The olive "takes" readily from cuttings. The cuttings preferred are those taken from mature trees and are made from twelve to fourteen inches long, of two-year old wood, or older, and from one to one and one-half inches in diameter. They are taken from the trees in December or January, and trenched in some convenient place, preferably in the shade, where they are kept till the middle of February or the middle of March, or later, when they are planted in nursery rows. The ground is thoroughly prepared. The cuttings are planted from twelve to thirty inches apart, and about ten to twelve inches deep. The soil is hoed toward them on both sides, leaving the cuttings covered to within an inch or two of the top, in the center of a ridge. The loose soil around the top protects the cuttings from being scorched by the sun. As the cuttings begin to grow, the shoots put forth through the loose soil and are not disturbed. They are allowed to grow for one season without pruning. The removal of the growth the first season gives the cuttings a shock that prevents the formation and growth of the roots. Many growers plant cuttings at an angle of about forty-five degrees. The season following all shoots and growth are removed, except one which is to form the tree. This one is carefully trimmed, and a stake is driven close to it, to which it is tied.

PUMPING PROJECTS.

Chief Engineer Newell reports that rapid progress has been made on the several pumping projects in North Dakota. These projects contemplate taking water from the Missouri river for use on adjacent lands, by means of immense pumps. Throughout the part of the state where pumping is feasible there are immense beds of lignite coal, which will afford a cheap fuel.

Owing to the fact that the Missouri river is continually cutting its banks, it was found impractical to locate any structure like a pump on the banks. To overcome this difficulty the Reclamation Service is building the power house and placing the heavy machinery for developing power at the coal mines, and conveying the power by electric conduits to the pumps, which are located on barges moored to the shore.

The construction work on settling basins, power houses, and distribution systems is well advanced, and it is expected that the machinery will be put to the test in the spring.

STILL WITH THE FIRM.

A big New York wholesale house not long ago started a certain drummer on the road giving him $200 for traveling expenses. [illegible] passed and nothing was heard from him. Finally, the house, becoming impatient, telegraphed the deliquent as follows:

"No advices from you since you left. Are you still with us?"

In a little while the answer came:

"Referring yours of fifteenth. Have drawn on you for $250 additional. Am still with you."—Lippincott's.

By J. W. MILLS

BUDDING OVER OLD TREES.

At a recent meeting of the Lemon Men's Club held in the Los Angeles Chamber of Commerce, the subject of budding over old orange trees was discussed. It developed that some of the lemon men had some Valencia trees, which they were going to bud to lemons. Still others had a few Washington navel trees, which they might bud to lemons. This was rather significant when we stop to think that a lot of people are falling over themselves to pay from a dollar to a dollar and a half for Valencia trees to plant.

What Buds to Take.

The best methods of budding over old trees was discussed. It was the opinion of those present who have experience, that cured buds gave the best results. The buds should be selected from the bearing wood of the trees and should not be much larger than a slate pencil. One member remarked that when a budder used buds from a branch that was as large as a lead pencil, he was surely getting his buds from sucker wood. Those buds should be condemned on general principles. Buds from bearing wood on lemons are of course to be found on larger growth than those on orange wood of the bearing class.

When orange buds are to be selected, they should be taken near the ends of the branches, which will be the early growth of the past summer. This wood will be round and well matured with the buds still dormant and the last spring's leaves still vigorous. Cut the bud sticks a few weeks ahead of budding time and keep them in damp sand, but not too wet. The scions should be toughened in the process.

The eyes of the buds are very brittle when first cut and this curing process toughens them. It also places the bud in a receptive condition for the sap. That is, it reduces the percentage of sap in the bud, below that of the tree when it is in proper condition to bud, and as a consequence, the bud takes up the sap from the tree, when it is inserted, just as a moderately dry sponge takes up the moisture from a wet surface. It is the interchange of sap immediately after the insertion of the bud that makes the union. If this interchange does not take place at once, granulation on the stock will commence and the bud will die.

How to Insure Success.

When the bark slips the best common cotton strings will make a good wrapper, but they are slow to use as it takes many more wraps to cover the bud than it does with strips of cloth. Waxed cloth is the most commonly used and should be made by dipping sheets of cloth, new cotton such as light sheeting is made of, in pure boiling beeswax. The surplus wax should be scraped off by drawing the cloth between two sticks.

Spread the cloth out evenly to cool and tear in strips about five-eights of an inch wide. There has been considerable trouble during some seasons, with a fungous growth that kills the buds. Upon removing the wraps, the buds will be covered with it and such buds die. We are not sure but that dipping the wrapping cloth in a strong solution of bluestone water and afterward rinsing in clear water to remove the fungicide, will reduce this loss from fungus. It is important to rinse the surplus bluestone off before using the wraps as it is corrosive and may injure the buds.

When large trees are to be budded over, which is best done in May or late in April, all the main branches not used in budding should be removed at the time the buds are inserted. This throws the surplus sap into the remaining branches and seems to insure a better flow of sap into the newly inserted buds.

An incision is made lengthwise with the branches, several to the branch, and with the budding knife, held with the back of the blade slanting down, a crescent-shaped cut is made across the lower end of the perpendicular incision, and before removing the knife make an upward movement of the blade which will lift the two corners of the inverted "T" shaped incision.

The bud is inserted from below and pushed upward. This prevents water from running down and around the bud. Wrap with the waxed cloth, leaving about an inch of the cloth sticking out at the point of beginning, wrap over the bud and back, bring the two ends together and twist them.

The wax will stick the cloth and obviate tying. In cutting the bud, make a straight cut about three-quarters of an inch long, leaving the wood beneath the bud in place. The leaves should not be pulled from the buds when the scions are taken from the tree, but must be cut off so as to pro-

(Continued on page 248.)

ALL ABOUT THE
Orange* and *Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling bud to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed — 50,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

California Horticulturally

By JOHN ISAAC, Sacramento, California

SHIPPING FRUITS IN GAS.

THE experiments made at Antioch of preserving and shipping fruit in nitrogen gas have progressed so far that the projectors are now assured of success. The theory is that fruit packed in nitrogen gas will remain for an indefinite time precisely in the condition in which it was packed, the gas destroying the germs of decay.

So, fruit surrounded by pure nitrogen gas and thoroughly excluded from the air would remain in the state in which it was subjected to treatment until wanted for consumption. This has been demonstrated in the laboratory, but when attempted on a commercial scale many new problems presented themselves which have had to be solved.

It was exceedingly difficult to manufacture an air tight package, and the slightest admission of air degenerated the gas and started decay. It was found difficult, too, to manufacture a perfectly pure gas, as other elements became mixed with it and corrupted it.

We understand that these difficulties have now so far been overcome that it is not improbable that the coming season will see the new process put into actual operation on a commercial scale. If all the projectors hope for it proves true, fruit can be packed when fully ripe, and kept for years and shipped to any climate, and be opened for use as fresh and luscious as when picked from the tree. It is needless to state what this means to the orchardist, or that the projectors have the best wishes for their success of every fruit grower in the State.

DISHONEST TREE SELLERS.

A bill, the intent of which is good, has passed both houses and is in a fair way to become a law in a short time. This provides penalties for selling trees under false names, or by misrepresentation and prescribes methods of proceeding against parties guilty.

An act of this nature, is worthy of the severest punishment, for it not only cheats the purchaser out of the cost of the trees, which is trivial, though bad enough, but it deprives him of years of labor, the use of his land and the value of a number of crops which should be the reward of his work and patience.

The planter has got to take the nurseryman's word for the trees he buys, and he pays for them, plants them, cares for them, devotes his land to them on his faith, and it requires several years before he can tell whether he has been honestly dealt with or not. How this new law will catch the tree peddler and agent who are far away when the evidence of their deceit appears, it is impossible to tell, and it is this class who are the worst, not our local nurserymen who have a reputation to maintain.

HORTICULTURAL BILLS.

The legislature is wrestling with several bills in which the fruit growers of the state are deeply interested. First there is the one making an appropriation of $12,000 for continuing the search for beneficial insects, which is now well on its passage and will undoubtedly pass.

Then there is one increasing the compensation of horticultural inspectors from $2.50 to $3.00 per day, this bill is also well on its passage, and as it is a just one, will undoubtedly become a law. Now a new bill has been introduced by Senator Willis, completely revising the law organizing the County Horticultural Commissions. It does away with the three-men commission and provides for a single commissioner, who is to be appointed for four years and who can only be removed for cause.

His compensation is placed at $6.00 per day. It makes several important changes in the present law ,and has very strong backing in the legislature. Another bill makes an appropriation for continuing the fight against the pear blight, so that altogether the fruit growers' interests are being pretty well looked after by the present legislature.

GOOD WORKING WEATHER.

Farmers and orchardists alike have been taking advantage of the fine weather of the latter part of February to catch up with their work which the continuous bad weather of the winter had so seriously delayed.

Plowing and seeding have been rushed in all the grain sections, and while the total area will fall below the normal, there is still a very large acreage being sowed to grain. With late rains, which are probable, this will yet make grain, and at the worst will make good hay for which there is always an active demand.

Pruning and spraying were both very much delayed but work along these lines has been rushed and, with few exceptions, has been finished before the trees started to leaf out. So, while the season has been unpropitious for work in the open, this has now been pretty well done.

FRUIT PROSPECTS.

Deciduous fruits are now in bloom, that is some of them are, and the fruit buds are all swelling. So far, there is every promise of a good fruit season.

There has been no unseasonal hot weather to start the sap or force the trees into immature blooming nor have we had any unduly cold weather to chill them. If we escape heavy rains during the blossoming period and late frosts we shall be all right for the banner fruit crop this year.

SUITS AND BOOTS

If you are interested in Outing Suits, Headgear, Footwear, Shirts, Leggins or Gloves, send for our new Catalogue. It is printed on heavy book paper, contains numerous colored plates and many fine cuts of clothing and footwear actually in use; and is the handsomest Catalogue of its kind ever issued.. Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno. Cal.

THE COLTS.

"ALL THE world love a lover," but far more does all the world love youth. The young vineyard and orchard have a charm of expectancy; they are a vision of the future. The hardest money-grasping man's eyes will lighten and glow when he tells of his new planting of vines or trees.

Babies of the Barn.

The babies of the stable and barn, the colts and calves, are full of winson frolic. To the breeder of fancy stock there is more than fascination in watching the conformation or type reappearing, it tells of the various ancestors. The eye learns to see in the form of the colts the blood of the thoroughbred, or of old Hambletonian, Wilkes, or other noted family of horses cropping out in the youngsters.

Our Holstien calves show the strains of their ancestry as marked as the colts, Methchildes, Pauline, Paul, Netherlands or De Kol crops out markedly in these wee ones. The innocent gentle faces of the colts and calves are appealing, how can anyone help but love them?

The funny little colt runs around his mother, twitching his stubby tail and arching his neck, as he makes believe to be frightened. The next moment his bright eyes are viewing you from under his mother's body. Move toward him and he darts away, timid, coy and yet lingering to be coaxed, hoping to be petted, yet fearful of familiarity. You are to him the great world and he desires, while dreading, to know you better.

The first six weeks of a colt's life is best spent with his dam in a green pasture, quietly away from other horses.

After Six Weeks Old.

After six weeks the colt will be better nourished if the dam receives grain feed and regular exercise; she should be worked to a wagon with the colt following her.

Two of our mares with their colts running loose are used on the manure wagon around the barns, two more haul the wagon to feed the dry stock with hay; these short hauls with long pauses are not too much for the colts.

When the colts are five months old they are separated from their dams, and are put together in a corral. The mares then take their places at full time work. At noon after the mares are fed and watered and cooled off, they are turned in with the colts for an hour, then they go to work again. At night, as soon as they are cooled off, they go into box stalls with the colts.

The mares must be well fed, so as not to stunt the colts. The colts are fed bran with a little rolled barley added and plenty of bright alfalfa hay.

Weaned at Six Months.

At six months the colts are weaned. This is not difficult It is done by lengthening the time between the nursings, omitting at first the noon time; then at night.

The mare must be watched and milked out if the udder is too full, milked a little but not clean, for the idea is to make the mare go dry.

The weaning time is not definately fixed at six months, as we prefer to have it come when the grass is good, for that keeps the colts growing right along. The colts live on alfalfa pasture the first summer, until it begins to grow hard and tough, then their feed is added to with rolled barley beginning with bran and a little barley. It is soon made straight rolled barley. As the pasturage shortens the need increases for feed and bright alfalfa hay is added, always enough to keep them growing fast.

The colts are supposed to live outdoors and some winters the sheds are shelter enough. When long, heavy storms of wind and rain come as they have this winter it is well to shelter the colts better. Ours have this winter been turned loose in the barn durthe heavy rains. The yearlings and two-year-olds have been tied up in stalls like old horses at night. During the day they have run out in the corrals with the weanlings.

Training the Colts.

At weaning time one man is given the work of handling the babies. He halters them, trains them to lead and stand tied. Then he bridles them and drives them around with long reins. As soon as they go nicely and obey at, "whoa," "back," "stand over," "Get up," they are turned out once more.

This early training is more important than many think, for they are easily handled and it makes them gentle. If they are sick at any time they can be handled without making them terror stricken.

Many a colt has his gait spoiled by unshapely feet. The hoofs should be watched and shaped with a rasp, whenever they become long and break at the edges. Quarter cracks are common among the colts of the heavy draft breeds if their feet are neglected. The feet should be kept level and not allowed to grow more on one side than on the other.

When a year old the colts should be hitched up to a breaking cart with a steady horse and learn to pull a light weight. They should not go out of a fast walk, but should have half a mile a day for a week or two until they are steady.

The worst fault a young horse can have is throwing himself. When this happens have some one put their knee on his head and switch him gently over the nose a few times, using a small light switch that will sting. A couple of these switchings often ends the trouble.

As soon as the colts show they understand what is meant by pulling along gently, turn them out for a year's time. The yearlings should receive a little grain when the grass gives out, and be kept growing right along.

At two years old I prefer to have them do nothing for they are then weedy and the legs are easily put out of shape. It is the age to develop splints and curbs.

At three years they can be put at light work, half days at a time for draft horses, while the driving colts can be jogged two or three miles a day with safety. At three and a half to four years they are usually ready to do a day's work. Care must be used, however, and if they grow thin turn them out and feed them into good condition. At four years old they should do full work and come in frisking.

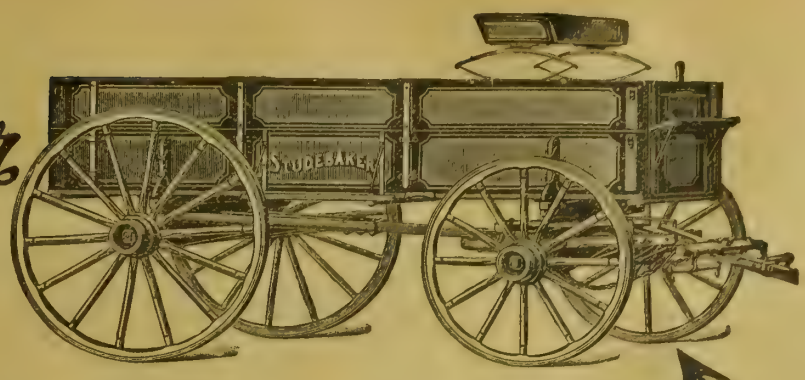
How a Studebaker Saves You Money



THE way to figure the cost to you of a wagon, a carriage, a buggy or a set of harness——

Is to figure the *cost per year* as long as you use it.

If a farm wagon, for example, that costs you $60 lasts 20 years and requires only $2 repairs, the *cost to you* of that wagon is $3.10 a year.

If another wagon costs only $50, and lasts 10 years, and requires $10 worth of repairs, the cost to you is $6 a year, at least.

Which is the cheaper?

* * *

There is no doubt about the *lasting* qualities of Studebaker wagons, carriages and harness.

It's the material that goes into them—plus the way they are made.

Studebaker farm wagons have axles ¾ inch deeper than others, made from selected butt-cut Black Hickory—*air-dried* from 3 to 5 years.

The axles are also *re-inforced* with a special bar of steel running from the heel of one skein to the other.

The Studebaker Patent Truss Skeins are made from cast iron having a transverse strength of over 3,000 pounds to the square inch—25% greater than the requirements of the United States Government—and probably 50% greater than the ordinary wagon.

The Studebaker hubs are large in diameter—furnishing a proper foundation for the spokes. They are treated with a secret solution, which greatly adds to their weather resisting qualities.

The Studebaker slope-shoulder spokes—one of the greatest improvements ever made in wagon building—carrying the largest amount of wood into the hub. They are *strongest* where other spokes are weakest.

See the Studebaker Agent

The Studebaker patented round-edge tires are *oil-welded* and *cold-set.* That's why they never loosen.

And so on—point by point—feature by feature—nothing that will add to the durability and long life of the Studebaker is overlooked.

Do you wonder that it lasts?

Do you wonder that it is the wagon with a reputation behind it?

You cannot afford to buy a "cheap" wagon, when you can get the best for so little.

It is poor economy to be constantly paying out money for repair bills.

Get a Studebaker and save money.

Go to the Studebaker Agent

and examine the Studebaker for yourself. Ask him for a FREE COPY of the Studebaker Almanac for 1907. If you don't know the agent, write us. Enclose a 2c stamp and we'll send you the book free. Please address Desk 78.

Hague Domestic Oil Burner Co.,
214 Winston St., Los Angeles, Cal.

CROP ROTATION.

Since the early days of agriculture in every part of this country farmers first robbed the soil of its fertility and then resorted to various devices to get a paying crop. A favorite device was to run away from the problem and seek new land; another, to give the land a complete rest from production.

In the meantime live stock increased, and barn manure, at first a farm nuisance, was more and more applied to the land, manures were composted, commercial fertilizers were employed, and sod was plowed under every few years. A true conception of the benefit, almost necessity, of rotating crops gained a foothold under the stress of hard conditions, and this explained into farm practice, even to the extent of raising manuring crops for the sake of plowing them into the soil.

For California, it is impossible to arrive at a fundamental crop rotation on acount of radical differences in soil, water supply, and climate. The reports show the practices to be almost as numerous as the counties, and indeed some counties have several practices in different parts. With regard to wheat and barley in some parts the general pratice is that the land rests every second or third year, in which it produces nothing but weeds and wild oats.

EULOGY OF THE HOG.

No reflection, hygienic or sanitary, is cast upon your city when I say that, for the hog, it is the most unhealthful in the world. I can count back 64,000,000 of him that have come to Kansas City, and the records show all dead. Therefore, as his next friend, I come to make a few remarks and introduce resolutions.

From antiquity, through the long progress of years, he has become civilized, is a debt payer, a mortgage remover, and a buttress of prosperity. He yields great luxury. He must be reckoned with by the luckless explorer of the Yukon. He is an automatic reducer of the corn supply and a raiser of the price. He is a bucolic bond whose coupons are large litters of pigs.

He is a patent pig, a condenser of ham, head cheese, glue, bristles, buttons, fertilizer, saddle covers and sausage. He is a mint, and the yellow corn is the bullion which he transmutes into coin. In all homes he is on the tables—high-born, rich and poor. He is with the soldier in the camp and the sailor on the deep.

At $2.25 per cwt., he is a plebeian, and we won't speak to him when we meet him on the street. At $7.25 cwt., he is a gentleman and a scholar and stops associating with the country people. He comes to town and becomes an aristocrat, but gets it in the neck at the packing-houses, is bled to death, becomes the commerce of the nation, the fat of the land.

The pig gets one luxury—dishwater. Dishwater contains preserves, molasses, pepper, tomatoes, milk, onions, steak, gravy, pickles, grease, cheese and exiled dishrags. It is sour and sweet, wholesome and toothsome.

In Texas they have the razorback hog. He is made up after the Swiss cottage architecture. The highest peak of his corrugated back is six inches above his tail. His tail hangs like a dishrag from a back window. He leaves the impression of a man starting late to his office in the morning. He lives on roots and peanuts. He will help his neighbor gather his crop by crawling under the fence at night. Crossing him with blue blood gives little improvement. The only effective way to cross him is with a railroad train. He can hide himself in a haystack where the hayknife has been rammed in and pulled out. His side meat is sometimes used for window glass. He is imperishable and can be used for a posthole digger.

One enthusiast says that the pig would be a better emblem of our nation than the eagle. The pig is thrifty, peaceful, far more representative of American character than the rapacious eagle, whose beak and talons signalize nothing but war.

Napoleon lost at Waterloo because his army had soup and the English had bacon. Ingalls would have gone back to the senate if he had not subsisted on oatmeal and baked apples. If you wish to rise to the glory of poetry and song, feed the fodder to the cattle and eat the beef and pork yourself.

The hog is found highly developed among a high-class people. He is impossible among low people. In good environment the hog and his twin, the steer, are the chief alchemists of fortune. He makes iron nerves, cool brains and brave hearts. He put courage into the men at Manila Bay; he cooled the heads of the heroes in the Chinese occupation, and he warmed the bellies of our gold hunters in the frozen North.—F. D. Coburn.

A GOOD COW.

Some men can judge by the looks of a cow whether she is a good milker or not. A good cow must have a big, round barrel, and a good pair of lungs, a wedge form, a good big udder and prominent milk viens. Generally a heavy horn and thick tail indicate beefy tendencies. The Babcock test is the surest method of determining wheth er individual cows are paying or not, but keeping the milk of certain cows seperate and churning it in a small churn by itself is a very practical way of finding out what each cow is doing in the butter line.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

MACHINE MILKING.

The following article appears in the Kansas Farmer, written by B. F. Cowgill. The farmers of the Sunflower State must be somewhat behind the times in regard to milking machines for we have had them in use in different parts of California for a considerable period and we are at the present time carrying an advertisement of one of the most approved type.

The editor has seen the milking-machine in practical operation. It was during the corn show at the Agricultural College. The crowd of interested visitors was so great that there ought to have been trouble if there was any chance for it. Many cows were milked at the same time. An attendant told the writer that he could manage three machines milking six cows. It seemed to take about as long for the machine to milk a cow as for an expert milker to perform the same work, so that by using three of the double machines and milking six cows at the same time, the capacity of the man is greatly increased.

The sucking of the machine is very much like that of a calf, except that the machine sucks all four teats at once. The machine does not 'hunch" as the calf is sure to do if the milk does not come fast enough to suit him. There is no apparent reason why the machine should not get all of the milk. If left to work over time it does not seem to annoy the cow. Some of the cows seemed a little nervous as the attendant attached the suckers, but became entirely quiet as soon as the suckers get to imitating the calf.

There is a great advantage in machine milking on account of its cleanliness. If the teats are clean, no dirt can get into the milk. It is drawn through a rubber tube into a tight vessel, the only breathing hole of which is closed with antiseptic cotton.

The power used at the time of our visit was that of a steam boiler. A vacuum was produced by a steam jet. This is steady and easily operated. A gasoline-engine and air-pump are sometimes used. Perhaps a tread power and pump would answer the purpose well.

The apparatus is not difficult to clean. The closed vessel into which the milk flows is heavier than a large bucket, but otherwise not much more difficult to clean. The rubber tubes and the rubber suckers have to be kept clean. This need present no serious difficulty. Cold water, hot water, or any kind of wash may be drawn through them by placing the suckers in the wash and operating the machine.

If there are details to be brought to greater pefection, this will doubtless be done. The milking-machine should be on the market very soon. It is not adapted to the use of the small dairy, but will certainly be found profitable where great numbers of cows are kept.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

When writing advertisers mention Cultivator

VALUE OF COWPEAS.

Tests have recently been made at several experimental stations to prove the adaptability of cowpeas for dairy cows.

Of course the general value of this crop has been recognized for a quarter of a century by many dairymen, but quite recently the subject has received prominence because of the experiments made.

"The hay with the peas on is equal to corn and hay," is almost a proverb on the farm. But how is this feed for milk production? It is interesting to learn that in a test in pasturing dairy cows upon several kinds of annual crops at the Missouri station, cowpeas proved to be the best milk producer. At least so says the St. Louis Journal of Agriculture. At the Missouri station, in 1903, when cattle were pastured daily in a field which contained a variety of annual pasture crops in separate plots, it was shown that the stock relished green corn best and grazed upon it in preference to all other crops. Next to corn, "soy" beans were preferred. The third preferance of the cattle was probably for cane. The fourth was for cowpeas. But, notwithstanding, it was observed that in the plots where cowpeas and corn were growing together the peas were well eaten before the cane received much attention. The suggestion is, then, that it would always be well to plant a little corn with the peas for pasture, though the former should not be planted so thickly as to shade the latter. With cattle, the grazing on peas may be begun earlier than with hogs or sheep—and while the crop is still green and growing.

Cowpeas are not grown for feed much in California, Canadian peas being preferred. But if experiments were made along the line of fodder, instead of fertilizer for the orchard alone, we might find cowpeas quite as valuable as they do at the eastern experimental stations..

CLEAN UDDERS.

We know dairying is only in its infancy in California. The time is not far distant when the State will not only produce its own consumption of butter but supply the South and Southeast with butter.

We doubt if dairymen generally ever read of the scheme devolved by an Iowan to keep his milk clean. The usual way of cleaning the udder is by washing it and wiping it dry, another way is to brush it well. The former is the better plan, but where there are a number of cows it requires too much time—at least milkers think so. It has been demonstrated beyond argument that to obtain pure, sweet milk the udder and teats must be absolutely clean. This Iowa man has a new and novel way. He cuts the hair off. This is what he says:

"My experience has been that a cow gets quite woolly in winter. The strictly dairy cows that are kept in warm barns do not have such a growth of long hair on the udder as those that are common cows receiving common care. But in either case the cows need a hair cut, and need it often. But here's another hint. When I first tried to give a cow a little trimming up so I could find her teats, I used scissors. All went well till I cut a little extra teat that was hid in the underbrush, and then the job was over—so was I. But I got a barber hair clipper for a dollar and used that with never a kick and kept the cows udders free of hair so that there was nothing for bedding and dirt to adhere to.

The looks alone will pay for the trouble and the cost of the clippers. You can trim up the tail and improve the appearance of the cow very much. Try it."

We would not say to try it, but we would think about it, for the cow is likely to take cold if the covering nature has provided is removed.

PROFIT IN SHEEP.

The growing scarcity in this country of the "animal with the golden hoof" is to be deplored. A writer in the Country Gentlemen says, all his life he has been interested in sheep-raising, and followed it when prices were low and when they were high, in order to find out if sheep-raising could be carried out at a profit. After a rather long experience and careful study, he was able to say that he was certain that sheep-raising was a paying undertaking. Even when the prices for wool and mutton were very discouraging, myself and my neighbors were able to make this department of the farm pay, and considering all kinds of prices, the average profits of sheep-raising were as good as those of any other department of the farm work.

Every farmer should keep a few sheep—a dozen or twenty—to consume his rough feed, clean up his weeds, and yield him extra money, at a minimum trouble and expense. In fact, by careful selection, breeding and feeding, the profits the farmer can realize from his sheep will be greater proportionately than from any other stock. Instead of selling his lambs in the fall, when they are low in price, he should keep them until the early winter or spring, and so double his profits. Lambs worth $3.50 in the fall will yield a profit of from $3 to $6 if fattened and turned off later.

Griffing's Semi-tropic Nurseries, Sarita, Texas, has taken over the Gulf Coast Line Nursery, and will hereafter be under the management of W. C. Griffing. The new firm will give special attention to hardy citrus trees, the finer varieties of budded and grafted pecans and a general line of fruit trees, vines, plants, ornamental trees and shrubbery, especially adapted to Texas, Mexico and the Southwest.

Confident that a trial will convince any one of its superior merits, we will send to new customers one 25-lb.

$3.00 PAIL FOR $2.00

or one 50-lb. $5.75 double sack for $3.50, and will prepay the freight to any point west of the Rockies. Not more than 50 lbs. to each one, and we reserve the right to withdraw this offer without notice when we have received all the orders we care to fill at these very low prices.

We are presenting no cheap premiums nor offering any gaudily colored pictures, but are making this strictly legitimate business offer for the purpose of inducing many more to try WEST COAST STOCK FOOD. We thus hope to add to our large number of steady customers. We are charging up the difference and the freight to our advertising account feeling sure that a trial of the goods is the very best advertising.

There are no strings to this offer. Just send us your name, your post office address, the freight station to which you want the goods shipped, mention this paper, and we will do the rest. Send money order or check with your order, and if everything is not exactly as represented your money will be refunded. The First National Bank of this City, or Bradstreet's Agency, or any leading firm, can inform you as to our reliability.

West Coast Stock Food

Beyond Question the Best Condition Powder Made

Our Trade Mark

Long a Familiar Sight Hereabouts

A purely vegetable compound, very strong but harmless, and may be fed to calves, colts, lambs and pigs, without fear. It will make young stock grow and develop in a rapid yet natural way, while matured stock will maintain health and vigor by its regular use. It purifies the blood, tones up the system, acts on the digestive organs, enabling the animal to assimilate all of its food and convert the same into blood, bone, fat, sinew and muscle. Hence it is a **great feed saver.** It puts the system in proper shape to be sustained and developed in nature's own way. Its use avoids all tendency to tuberculosis. And besides being a general conditioner, this preparation is a cure for **Epizootic, Cough, Hidebound, Distemper, inflammation** of the **Stomach, Caked Udders,** and all sorts of **Colds,** etc. Specific directions in each package.

Your stock needs a condiment just as you need salt and pepper—they relish the food better and digest it better. Read what a leading professor in a prominent agricultural college, in a recent article on Stock Foods, says:

"They will always be found useful when properly made. The time will never come when intelligent feeders will cease to use them. The necessity for using them and the advantage therefrom will become greater as foods become increasingly dear. Whether it will be profitable to feed them will depend upon the necessity for using them and on their cost. My special desire, however, is to show that they have a place in the economy of intelligent feeding. The question of price must be fought out between buyer and seller."

The best is always the cheapest. A dollar's worth of **West Coast Stock Food** will go further and produce more and better results than will two dollar's worth of many so-called "stock foods" which contain a large amount of cheap filler. **West Coast Stock Food** is highly concentrated and therefore less needs to be used. Why buy stuff shipped over the Rockies at high freights, when better goods, better adapted to these west coast conditions, are made and sold right here at lower prices. **West Coast Stock Food** has been a standard preparation upon this west coast for many years. It is the result of long, careful, and intelligent experimenting and study on this west coast and under its peculiar conditions.

MERCEDES JULIP'S PIETERTJE, H. F. H. B. 39480.

This is a photo of a Holstein cow of international fame because of her marvelous recordas a butter producer. In seven days, in a Minnesota mid-winter,she made 584 lbs. of butter, thus becoming the **Official World's Champion.** She was then owned by the present**President** of the **West Coast Stock Food Company.** It wasonly by recognizing and applying the principles of feeding weare now seeking to emphasize that this remarkable record was possible. This cow was bought for $200 and in less than eighteen months she, her heifer and her bull calf were sold for $3700. It pays to take the best care of stock as well as to feed them intelligently.

West Coast Stock Food fed to **Horses** and **Mules** will make their coats smooth and glossy, impart a vigor and "go" which enables them to render more and better service. For **Cattle** it is unequaled; it promotes assimilation of all the foods they consume and hence a strong flow of pure blood. We cannot expect them to put fat on their backs and ribs or into their udders, or to produce large, strong, healthy calves, unless the system is kept in good condition. The judicious use of this great conditioner will do much toward making the business of **Sheep Raising** more profitable. It causes sheep to gain in flesh, and given to ewes for one month before lambing time will improve their condition and increase the flow of milk, so that the lambs will be much larger and better every way. And for **Hogs** it is equally valuable. Their digestive organs have been overtaxed for generations. This food aids their digestion, purifies the blood and supplies many of the lacking natural ingredients of a perfect ration. Try it with hogs and note how rapidly they grow.

But don't take our word alone for all this. Read what other have said.

We hate to put this picture in here, because it isn't a bit pretty, but we want to show you what this calf looked like at 11 months old, before it had been given any West Coast Stock Food, and then have you read what its owner, Mr. Langstaff, says:

West Coast Stock Food Company: Elsinore, Cal., May 2, 1904.

Dear Sirs:—I have been in the cattle business for a number of years, always weaning the calves and feeding them skim milk. It is hard to keep their bowels right. We had two or three, as we thought, very good remedies. Last fall we had two calves that we could not cure, but we kept them alive for several weeks with our remedies. An old friend called on me and seeing these calves, he advised me to try West Coast Stock Food. I did not think it worth while as they were lousy and their skins stiff and scabby. There is no doubt that they would have died in a few days. I am glad to say I tried the West Coast Stock Food. **One package saved the calves,** and they have improved ever since. I am feeding twenty-three at the present time. I keep the West Coast Stock Food on hand and feed it regularly, and they have not been bothered with scours. Our best investment is what we put into West Coast Stock Food. Respectfully.

LANGSTAFF & WALTERS.

A Few Out of Many:

J. J. Thornton, Los Angeles, writes: "I am using your Stock Food and consider it the **best on the market** for colts and horses out of condition."

I. C. Milhous, Van Cleve, Iowa, writes: "As a blood purifier and all round condition powder, I know of **nothing better** than your stock food."

F. S. Rogers, Van Orin, Ill., writes: "For a blood purifier and to put the horse in good condition, it **fills the bill** and cannot be beaten."

J. B. Myers, Pasadena, writes: "I believe there is **nothing better** of its kind."

The Ornamental Garden

By ERNEST BRAUNTON

SHADE TREES.

NEXT to the pepper tree, we have seen none that proves more satisfactory, especially in the southern part of the state, than the tree known as St. John's Bread or Carob tree.

It even surpasses the pepper tree in one respect, that of cleanliness, and seems peculiarly at home in extremely dry locations. As a shade tree it is more dwarf and sturdy than the pepper and often needs trimming up in order to clear the lower branches from the ground.

While at Glendora a few days ago the writer visited the home of Mr. W. O. Kennard expressly for the purpose of looking at some fine specimens of this tree growing on the street line of his property. Those wishing a shade tree for that region should not fail to visit this place to note the great suitability of this tree to our foothill conditions.

Many other fine specimens may be seen in this garden, but it is not the intent of this article to write a description of fine or rare plants in general or at all, but there is one more tree growing there that calls for special mention. This is the Silver tree of the Table mountain, Cape of Good Hope, which will not thrive away from home, except in California. As it loves a rarified, damp atmosphere it is most remarkable to find it thriving inland so far as Glendora, even though that favored section is able to grow most anything in plant life.

OVER PLANTING.

A mistake which many make when tree-planting to beautify the home is undertaken is to forget the effect which time and growth have upon the specimens set out around the dwelling.

This condition is often seen and is a cause for regret when it is not easy to repair the blunder. The innocent-looking evergreen shrubs which are set out to adorn the door-yard between the dwelling and public highway, are not suspected of having the inherent quality of development into trees that in time will loom up and hide or overshadow the house, but in riding about the country these effects are frequently seen.

At the same time one may observe the result of not extending the system of adornment beyond the house-yard limit; for while in some cases scarcely more than the house roof is visible to the passerby, the existence of stables, hogpens and outhouses are painfully and disagreeably apparent.

Had the idea of adornment which prompted the filling up of the door-yard been liberal, or even elastic, what is now a dangerous and unwieldy surplus would have extended to the present bare and unsightly portions and there would be a more satisfactory outlook.

Few persons have the nerve to make a clearing among trees whose development has been watched with solicitude and gratification these many years; while to remove them is an undertaking which is too doubtful of success to be recommended except in special cases. But it were better to get one's courage up to the point of removal than to trim-up solitary trees and expose their bare trunks in order to look out from the windows or permit the house to be seen.

FARM FERTILIZERS.

Soot from the chimneys is one of the recommended fertilizers among amateur florists. It is claimed to ward off certain insects, and to destroy the worms in the soil, and is an excellent fertilizer and invigorator.

Ashes are also included in home fertilizers. It should be remembered, however, that the ashes from wood and not from coal fires should be used and then only small quantities in confined soil. In using the chimney soot for pot plants a teaspoonful in a pint of warm water is about the proper proportion.

LANDSCAPING RULES.

The first principle of artistic gardening is to secure as wide and unbroken an expanse of lawn as possible. This rule is one that should never be violated.

A close-cut and velvety lawn is the most beautiful and restful thing about a home. It is the foreground of all scenic garden effects. Shrubs and trees, on small grounds, should be at the outskirts or in opening bays, while all flower beds should be near walks or driveways.

A narrow yard gains apparent width when in the foreground there is a smooth expansion of green. So well do landscape gardeners understand this that it is a common expedient with them, where lots are narrow, to place the walk or drive at one side so that the body of the lawn is thrown together, making it appear a third larger than if the walk divided it. Avoid an intricacy of walks, unless it be a shrubbery. Don't plant trees too closely together if of kinds that reach a large size. Keep the lines of vision from windows and doors free and open.

FLOWER POSITIONS.

The main planting of any place should be of trees and shrubs. The flowers are then used as decorations. They may be thrown in freely about the borders of the place, not in beds in the center of the lawn. They show off better when seen against a background; this background may be foliage, a building, a rock, or a fence.

Where to plant flowers is really more important than what to plant. In front of bushes, in the corner by the steps, against the foundation of the residence or outhouse, along a fence or a walk—these are places for flowers. A single poppy or petunia plant against a background of foliage is worth a dozen similar plants in the center of the lawn. In a cozy back yard the shrubs and trees should be the main features, and bright flowers the incidents. Too many flowers make a place over-gaudy. Too much paint may spoil the effect of a good building. The decoration of a yard, as of a horse, should be dainty.

ANNUALS.

The annual flowers of the seedsmen are those which give their best bloom in the very year in which the seeds are sown. The true annuals are those plants which complete their entire life cycle in one season. Some of the so-called annual flowers will continue to bloom the second and third years, but the bloom is so poor and sparse after the first season that it does not pay to keep them.

Prepare the ground thoroughly and deep. Annuals must make a quick growth. See that the soil contains enough humus or vegetable mold to make it rich and to enable it to hold moisture. If the ground is not naturally rich, spade in well-rotted manure or mold from the woods. A little commercial fertilizer may help in starting off the plants quickly. Prepare the land as early in spring as it is in fit condition, and prevent evaporation by keeping the surface loose by means of raking.

The black man's burden—Foraker; the white man's burden—Tillman; Tillman's burden—Roosevelt; and Roosevelt's burden—The whole bunch.

The Vegetable Garden

By ERNEST BRAUNTON

GARDEN FERTILIZERS.

THERE are innumerable brands of mixed fertilizers offered by the men who make a business of preparing these in different proportions for various crops.

But oftentimes it will be found easier and more economical to mix the ingredients, which can be purchased for this purpose, bearing in mind that the more concentrated form in which one can get these, generally the cheaper, he will get the essential constituents, potash, phosphoric acid, and ammonia (or nitrogen.)

Most manufacturers of fertilizers always give the percentage of nitrogen in a mixture as ammonia, as this custom has grown universal from early practices. Ammonia is a compound of nitrogen and hydrogen, which has the properties of an alkaline base, and unites with acids to form salts.

Sulphate of ammonia and nitrate of soda are the two most concentrated forms in which we can get nitrogen, and they are valuable forms for the truck gardener's use. A highly concentrated form makes a great saving at times in freight and handling.

There are many advantages in mixing the constituents at home, as in that way particular ingredients can be used for special crops, or advantage be taken in using local supplies. The purity of these ingredients can be ascertained by analysis, and their proportion in the mixture can be altered to secure any desired percentage.

When buying the ingredients they should always be purchased on a special guarantee. When mixing at home the materials should be as dry and fine as possible, and should some be lumpy, as in the case of the potash salts or nitrate of soda, the lumps should be mashed before attempting to mix.

A clean floor should be used for the mixing, and the ingredients, weighed out in proper amounts, should be poured on top of each in alternate layers. Two hands, with hoes, on opposite sides of the heap, can mix the layers rapidly, at a cost not to exceed fifty cents per ton. When mixing a small quantity a wagon body is very convenient to use. Where large quantities of fertilizers are used, and sufficient power can be had, it will pay the grower to provide the necessary machinery for mixing the ingredients.

VITALITY IN SEEDS.

There is a great difference in different plants in this respect. Some seeds quickly lose their vitality, while some retain the power to germinate for a very long time.

Lettuce seeds are not usually ranked among those which retain their vitality many years, but when well kept they may be trusted for several years. Beet seed will retain their germinating power for at least ten years, under favorable conditions; cabbage, kale, radish, tomato, spinach, turnip, asparagus, broccoli, cauliflower, beans and peas, are all good for four years or more; while pumpkin, cucumber and melon seed will keep for ten years.

Onions and leek seed are not to be relied upon after the second year, and their vitality is much weaker even the second. It must be borne in mind that these figures refer to seeds that are kept under the most favorable conditions.

In the dry climate of our coast the duration of vitality will usually be found to be much greater than in any other part of the United States. Melon and cucumber seeds are more fruitful when two or three years old than when perfectly fresh, but make a less vigorous growth of vine.

In all other cases perfectly fresh seed should be preferred. In all cases get seeds from a seedsman of established reputation, and do not trust the seeds put out on commission.

GLASS IN GARDENING.

There is no point in gardening in which our growers are so deficient as in the skillful use of glass. They are too much addicted to the use of substitutes, in the shape of plant cloth, under the impression that it is cheaper.

We have had experience in the use of glass, and have tested the so-called substitutes, and know that they are not only less effective than glass, but in the long run far more costly. It is hard to understand the tardiness of our gardeners to appreciate the use of glass, since they are usually wide awake to any improvement.

Some seem to imagine that glass is only useful in the more severe climate of the Northern and Middle States. But a little experience of the great advantages to be attained by a skilled use of glass would soon satisfy any progressive California gardener that glass can be made as profitable in in all parts of this State as in the states east of the Rockies.

ROCK GARDENS.

To hear a person speak of a rocky situation as forbiding is not only to think of all these charming possibilities; it is also to be reminded of the stupendous floricultural features along the Riviera, where the once grim mountain sides are gemmed with villas set in riotously lovely gardens all the way from the saphire Mediterranean up to the misty line against the turquoise sky.

The Superior Gas Generator

Is a Complete

Home Gas Plant

Endorsed by Thousands of Users as Perfectly Satisfactory and Just as Represented.

1. The SUPERIOR is absolutely safe, economical and ready at all times.
2. There is no trouble to install, operate or care for it.
3. Fully guaranteed as to material, workmanship, and operation to give perfect satisfaction.
4. It generates a superior quality of pure gas.
5. It can be placed in any house or public building, whether old or new.

We are the largest manufacturers of Acetylene Generators on the Coast and are in a position to substantiate all of our claims as to the Superior. Our new factory is modern and fully equipped to meet every demand.

Read These Voluntary Testimonials:

First National Bank, Los Angeles, Feb. 20, 1907.

SUPERIOR LIGHT AND HEAT COMPANY:—

Gentlemen:—Having used one of your Superior Generators since December, 1905, it gives me great pleasure to say that it is a fine machine. It is economical, durable and in fact an article anyone cannot well afford to be without, if they wish to have good lights in their home.

Wishing you the best of success, I beg to remain, Yours very respectfully.

(Signed) F. ATTRILL, The Palms, Cal.

Sept. 13, 1906.

Gentlemen:—It gives me pleasure to say that the No. 35 Superior Generator which I bought last May has been in constant use for lighting and cooking and has given the best of satisfaction. Anyone who purchases a Superior Generator of the Superior Light and Heat Company may feel certain of getting something worth having.

Yours very truly, (Signed) A. CARDINALI, Verdugo Road, op. Ninth St.

We have hundreds of others.

Tell us the number of rooms in your house and we will gladly give you full information as to size of generator required and cost of installing it.

Charles C. Navlet Co.'s New and Wonderful

Seedless Blackberry

The Handsomest, Finest Flavored, Earliest Ripening and Most Profitable Blackberry in the World

50c per Plant, 12 for $5.00

Delivered Free

Chas. C. Navlet Co.'s Seedless Blackberry is absolutely, unquestionably, superior in every way to any other Blackberry yet introduced. It commences to produce its luscious fruit fully four weeks earlier than any other Blackberry and is at its best when the other varieties are but just beginning to ripen. It is juicier and of a more delicious flavor than any other Blackberry. It is larger than the well-known Kittatiny, Crandall or Lawton, takes fewer berries to fill a basket, is far more attractive in appearance, finds a readier market and commands a higher price. If planted this spring and properly watered and cultivated, it will bear a small crop the first year—no other variety will produce fruit until the second year. It begins to bear fruit, if the season is favorable, between the 15th and 30th of May, and produces its heaviest crop in June and July. While not entirely seedless it is nearly so, and the few seeds it has are round and so small and soft that they are not in the least annoying. If you give it a trial we are sure you will think as highly of this wonderful Blackberry as we do.

Our handsome illustrated Bargain Catalogue of California-Grown Flowering Plants, Farm Seeds, Flower Seeds, Berry Plants, Fruit Trees and Ornamental Trees will be MAILED FREE to any address upon request if you mention the Cultivator.

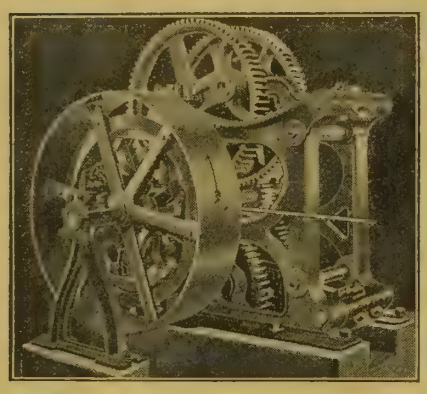
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Irrigation and Pumping

DRAINAGE WORK.

DICTOR M. CONE, the expert of the Department of Agriculture, who arrived from Washington to co-operate with Prof. Samuel Fortier in the latter's efforts to solve the problem of alkali and general drainage, is an advocate of an agricultural college in the center of the big agricultural districts of California with the principal building located on the grounds of the state university. Fresno, therefore, would be included among these sub-stations, as it represents a great raisin center. Davisville would be another point on account of its alfalfa, while Riverside or Redlands would be selected for the orange industry.

Naturally the farmers are opposed to the head institution being removed from their midst. The students prove useful from a manual labor standpoint, but the question arises, is it not better to collect the students in one place for their theoretical training and send them from time to time to the various sub-stations for the practical work? It has been demonstrated that agricultural colleges in Iowa and other states have been a source of extra expense to the university of the state because they are so far removed from the fountain head. The present legislature is desirous of reducing the $200,000 appropriation that has been asked for an agricultural college at Berkeley and while Mr. Cone admits he has no desire to mix up in state matters he is opposed to the reduction. Prof. Fortier also takes this stand and he recently appeared before a committee of the legislature on this subject.

Regarding his experiments locally Prof. Fortier made the following statement:

"A bill was passed some four years ago by the legislature to appropriate $50,000 to be used in conjunction with a like amount expended by various departments of the government. This bill was passed largely through the efforts of the Water and Forest Association of California, which comprises the leading men of the state.

"This $50,000 was divided as follows: The topographical branch of the United States geological survey received a part, the hydrographical branch another part, the forestry service a third and the United States office of experiment stations a fourth. The money was appropriated to ascertain the land and water resources of the state.

"The topographical branch mapped the arable and irrigable areas. The hydrographical branch measured the streams and located the reservoir sites. The forestry branch outlined the proper policy for the protection of the forests, and the experimental branch determined the proper way to use water and to avoid its waste. The last named was therefore employed not only to learn how to apply the water but to remove the surplus.

"We started all work on the assumption that the state would do its part. The government is willing to put up more than dollar for dollar, and as an evidence of this assertion our last pay roll in Fresno county alone was $700.

"The experiments here have been successful, and we are in a better position to demonstrate to the farmers the difficulties they are to meet wih. The water here in many places stands within 12 inches of the surface, which means 4 feet of water in a 5-foot trench. That condition has added to the cost of the experiments, but it has been of an enhanced value as far as the results go. This has been an abnormal season for rain and that we have been successful under such circumstances shows that we will be successful under normal conditions.

"We have overcome the quicksand by laying tile piping from 6 feet 9 inches to 4 feet and less from the surface. This piping or drain will carry off the water in such large volumes that there is every possibility that Fresno county will in time be able to construct a large canal and of this project I am very hopeful.

"The plan now that we are employing to drain the water from land is to first establish a sump with laterals running out from it. The second move is to build levees over the tract and apply large quantities of water so as to wash the alkali into the tiles and then into the sump where the water will be pumped out, raised 10 feet and discharged into a ditch."

Mr. Cone who was at the interview with Prof. Fortier, stated that California is interesting the government agricultural department more than any other state in the union, and the reason for this lies in the fact that she has more classes of drainage and irrigaion, more opportunities for studying entomology, plant biology, the examination of soil and every other line of the department of agriculture than any other state. California has a greater field for research because the investigtor can work here all the year round. It can also make one experiment station serve many purposes.—Fresno Democrat.

IRRIGATION IN INDIA.

"The topography of the Upper Mutha valley seemed very familiar. Had I been suddenly transported in my sleep to northeastern Arizona the similiarity in the topography of the two regions could not have more strikingly impressed me."

The foregoing sentences from Mr. Herbert M. Wilson's report on "Irrigation in India" serve as an indication of the interest and value which the work possesses for those engaged in the development of the arid and semi-arid regions of this country by means of irrigation.

India stands pre-eminent for her gigantic engineering undertakings. No other country has so vast and so fertile an expanse of territory, with such convenient slopes for the construction of canals, and at the same time such an abundant water supply. In general there is pronounced similarity between the climate and topography of the great northern plains of India and portions of our arid West, particularly the eastern slope of the Rocky mountains and the great California valley. Though the conditions of government and people are so different in India from those in America, many useful lessons may be learned from the methods of administration and legislation practiced there, as well as from the financial success or failure that has attended the construction of their works.

During the fifteen years that have elapsed since Mr. Wilson made the journey through India which formed the basis of his report, irrigation in America has made enormous strides, and immense areas of what were once considered absolutely waste lands have been turned into garden spots. In view of the keen interest felt by Americans in all irrigation maters, it is scarcely surprising that Mr. Wilson's report should be considered as timely today as when it was first published in the annual report of the United States Geological Survey for 1890-91. The demands for that publication were so great that the entire edition was soon exhausted, and as a result of increased calls, the report was carefully revised and a second edition was issued as Water-Supply and Irrigation Paper No. 87. Copies of the second edition may be obtained by applying to the director of the United States Geological Survey, Washington, D. C. The report contains detailed description of the irrigation works which exist under conditions similar to those in the United States, and is most profusely illustrated.—Maxwell's Talisman.

A woman sat up till 4 o'clock waiting for her husband. At last, weary and worn she went to retire only to find her husband in bed asleep. Instead of going down town, he had crawled into bed, which made his wife so mad she didn't speak to him for a week.

"How are you getting along with your new motor car?" asked the visitor. "Firstrate," replied Mr. Goldrocks, with enthusiasm. "We're getting to be regular autocrats."

Soft Harness

You can make your harness as soft as a glove and as tough as wire by using Eureka Harness Oil. You can lengthen its life—make it last twice as long as it ordinarily would.

EUREKA Harness Oil

makes old harness like new. Made of pure, heavy-bodied oil, especially prepared to withstand all weathers.

For all axle troubles use **Boston Coach Axle Oil.** Better and more economical than castor oil. Will not gum or corrode. Lasting, reliable, satisfactory. Highest Award, World's Columbian Exposition.

BACTERIA IN THE HOME.

(Continued from page 235.)

bacilli of tuberculosis or a typhoid germ. Often the men are ignorant that do this bacterial counting. Of one it is told that he stood up a dairy in the Coast region with a bacterium that he had found of great size. He thought it was an elephant, but it was only a fat globule—for the dairyman had been adding some fancy Jersey cattle to his herd.

The actual seeing that the milk of ailing cows is not used, that the stables are kept clean and the persistent use of the tuberculin test will do more to make the milk supply healthy than all the bacterial counting, as it is now done. The milk sickness of the middle west, fifty years ago, has now been traced to the bread. It was made with milk emptyings; these were contaminated and transmitted the bacteria from each lot to the next, for the sour dough ball was carried from baking to baking for a leaven. With the introduction of yeast plant the disease has disappeared completely. The yeast plant is a destroyer of other bacteria and finds use in medicine as a germicide.

Watch the Refrigerator.

The refrigerator is full of impurities and should be wiped out daily, and have a weekly scalding. The ice box should be flushed with hot soda water. When I made butter for the market and complaints came of butter not keeping, I investigated the refrigerators. The idea of making them receptacles for cold scraps seemed to be universal. In reading over the weekly menus in the magizines it seems as though the holding over of meat for a week in a cooked state was not uncommon. It is better to follow the Parisian custom of buying less, with a ham or smoked meat to fall back upon in case of extra company. Some of the mysterious low conditions, the people that are never quite well, can be traced readily to these sources, simple as they seem. Bring your housekeeping up to date and do not have a lot of left overs in the refrigerators; make the family food healthy by using food fresh and in simple dishes.

Bacteria are cultivated by crowding together sick and well people, in close quarters away from the sunshine and fresh air. No sewer gas, no dirt, no malnutrition can produce bacterial diseases. The germs must be planted like any other plant. All the above enumerated causes afford easy ground for them to work in; it is fertile soil for their life.

Vegetables eaten raw, as lettuce, should be throughly washed and then put into salt water before serving.

Dust Must be Avoided.

Dust must be avoided in the home. In the bed rooms, the bed often serves as a dust trap. Strip your bed tomorrow morning and see if the slats that hold up the springs are not full of dust! This can be prevented by making a lining. Use a piece of unbleached muslin sheeting the size of the bed; sew curtain rings on the edges and ends, then screw small eyelets into the bed frame and lace the sheet into place. If the bed is of metal the under sheeting can be placed to place. The bed linen should be changed twice a week or oftener if necessary. Blankets should be aired and sunned weekly, and washed twice a year. Those that wish to sleep next to blankets can use the thin blanket sheets and these are as easily washed weekly as the ordinary cotton sheet.

The bureaus, if not solid at the bottom, permit the dust to rise up through them; a sheet of large card board will keep the dust out nicely. The bedroom closet should be cleaned out weekly, and the clothes sunned, even the cleanest of clothes need cleaning, as we find out if they are left where the moths can work on them. After the closet floors are scrubbed fill the cracks in the floor with salt and then cover with oil cloth.

Clean Towels, Windows and Furniture.

Have clean towels in quantity for every one, a clean towel a day is not too much, or if this makes the washing too great, add a rack for each member of the household, and see that they keep their towels on their own racks. Eye trouble becomes epidemic in a place by the family use of the same towels. The time may come when we will all use the Japanese towels of paper and burn them every day. In traveling these are safer to use than the towels that have laid all night in the foul-smelling, air-tight little dressing room on the Pullman.

Wash out the dusting cloths; this is as important as washing the dish towels. After the dust cloths are washed and dried if they are dipped into coal oil and then dried, they will be found to pick up the dust nicely when used again. They wash readily if a little washing soda is added to the water.

A good cheap window cleaner can be made from whiting mixed with coal oil and a little borax added. Make into a paste and rub on the glass, letting it dry there and then wash off with hot water. Use a pound of whiting, quarter pound of borax and enough coal oil to make a firm paste; apply with a cloth.

Avoid plush and velvet covered furniture, English chintz or cretonne are sensible and not dust catching as furniture covering. Heavy window curtains are equally undesirable. If you have a lot of these curtains, have them rewoven into rugs for the floor and use them on mattings. Curtains of wash material should be hung on light poles that can be lifted down and carried outside once a month when the cleaning day comes—that day when the paint is washed and the walls swept down to make everything absolutely sweet. The weekly sweeping day will not be as hard if every room is thoroughly cleaned once a month, and then there need be no annual or semi-annual house cleaning to drive the men into despair, and scare the cat away from home.

In the kitchen have plenty of windows—one whole side of glass is not too much. Take the doors off the closets; if the pots and pans are in plain sight they will be kept cleaner.

Keep Scouring and Cleaning.

The kitchen sink needs to be flushed with hot lye water and if done weekly all the fatty matter collected in the traps will be washed out.

Every spring the house should be fumigated with formaldehyde; this makes sure that the bacteria are destroyed, it also will kill off all living moths, worms in the carpets and furniture. The druggist will furnish a candle of sulphur and formaldehyde, at a reasonable price, that is very convenient to use.

The use of carpet sweeper is better than the broom, for it does not stir up the dust but removes it completely; with the broom, if wet pieces of newspapers are thrown on the carpets and swept up, the dust clings to them rather than rise to fall again on the furniture. The feather duster is another disturber of the dust, it merely changes the location without removing the dirt. All sweepings should be burned.

The servants are often untidy and they should have a place provided to bathe and the family should set them the example of a daily bath. This daily bath is needed by every one to cleanse the skin from the impurities cast off during the day.

Clean Clothes and Fresh Air.

The sanitary home requires more than a clean house—it requires clean people in it. Clothes worn during the day should hang by the open window all night. The body is relieved of it impurities by a warm bath, and other clothing than that worn during the day. Use plenty of soap all over the body including the face; the soap used should be a plain one rather than the fancy scented varieties. If the face is thoroughly cleansed every night pimples and facial blemishes will disappear. You have only to look at the clean shaven faces of the men to realize what soap and warm water with out-door exercise will do for the complexion in the way of keeping off pimples. The ladies of ancient Rome in the palmy days of Augustus used soap as a beautifier and they were right in doing so.

The remedy therefore for bacterial infection is simple cleanliness. The best prevention is found in sunshine and fresh air, clean bodies and clean habits.

The freash air renders our bodies immune to diseases, yet how we fear the air, it is a little damp! I heard a brilliant speaker telling the school children about Mr. Roosevelt. He said that when Prince Henry was visiting him, one rainy day the President sent for his overcoat and away they went for a long ride in the pouring rain. Both came home very wet. Now the President did not fear a wetting for he was a cow boy, and Prince Henry did not for he is an officer in the German army. Over there an officer never carries an umbrella; he does not consider it dignified. The rest of the men do not as they would like to be considered as hardy as the officers. Now if a whole nation can go without umbrellas, surely the people of California should not stay at home for a little rain!

When we learn that wet is not harmful to a healthy body and that our health is a matter to be attended to daily, that it must come from care of the body, we have learned the first of the great lessons of life. The next lesson is that we are our brother's keeper in matter of sanitation, that others live as we help them, by the care we take, or die by the carelessness with which we live.

Let us stay out doors at all times, let us make it the fashion to be out doors to work, to write, to play, all the sunny day-time. Then tuberculosis will lose is deadly character and other germ diseases will disappear. California with her weath of sunshine all the year can be the healthiest State as she is now the happiest, in her natural condition, in the United States.

My lamp-chimneys sometimes get broken, but seldom or never break. There is a great difference.

My Index is useful to every one who owns a lamp, and it is free.

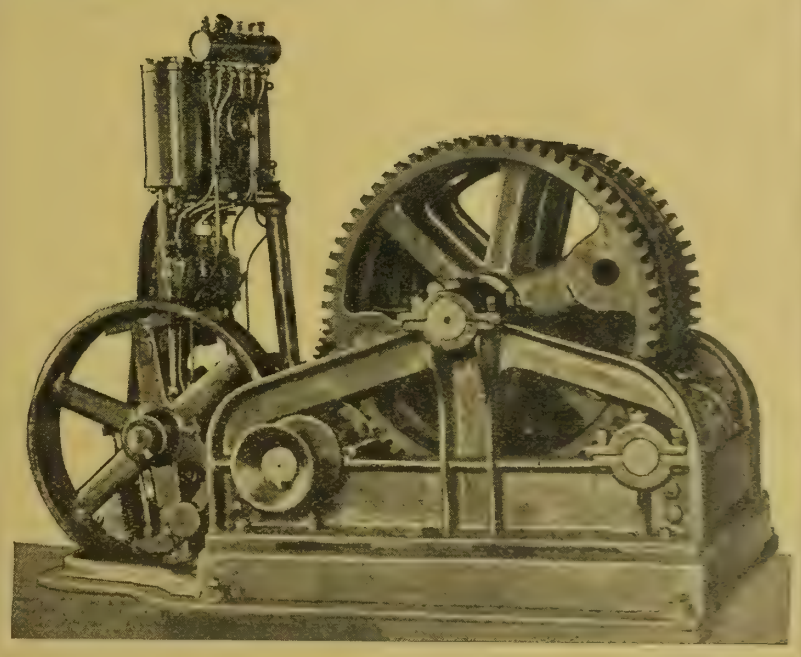
Addison Double Plunger Pump Head



Direct Geared to Steam Engine

One of four pumps installed for Bisbee-Naco Water Company, Naco, Arizona

Pomona, Cal., Jan. 7, 1907.

ADDISON PUMP CO.,
Pomona, Cal.

Gentlemen:—

The 24 Addison Pump you installed for us has given entire satisfaction.

We have 223 feet of rods and a 7-inch cylinder and are raising 18 inches of water to the surface, and are forcing it through 400 feet of 6-inch pipe to a reservoir 13 feet above the pump.

We use a gasoline engine developing about 16 H. P.

We think we have made no mistake in selecting the ADDISON.

Yours very truly,
MARTIN BROTHERS
Pomona, Cal.

It will pay you to investigate the Addison before purchasing a pump. Send for Catalogue B.

BEES AND THEIR CARE.—Raising Bees; The Bee Business; Good Queen Needed; Sweet Clover for Bees, 262.

A STATE MENACE.

One of the most serious conditions confronting California legislation is the presence of the hired lobbyist in the general assembly. It would seem that we have reached a point when the people of the state should rise in their might and demand of the legislature a rule excluding the lobbyist from the capitol building when the general assembly is in session. Never in the history of legislative assemblies have such high-handed and insolent proceedings been carried on by hired lobbyists as those witnessed this session at Sacramento. Scarcely a bill introduced which has had for its purpose the bettering of conditions of the state that has not been met at the threshold of its existence by a gang of obstructionists with the well defined object of causing its death, either in committee or on the floor of the assembly halls. So bad have become the conditions in Sacramento, that lobbyists fill the rooms of the various committees and actually attempt to dictate to members what bills shall be reported and in what manner they shall appear. If this is not sufficient cause for the legislature to enact a drastic rule of suppression of the lobbyist, where can a cause be found?

But California is not alone cursed with legislative obstructionists of this character. Kansas has them, but Kansas has dealt them a body blow by excluding them under severe penalty from setting foot in the capitol during the session of the legislature. The Nevada legislature has adopted a resolution forbidding any lobbyist from entering the state capitol during the session of the legislature for the purpose of plying his vocation. The resolution provides that any lobbyist caught plying his vocation in the capitol shall be punished according to the will of the legislature after a fair trial before the members of either house.

It is an outrage on ethics and morals to permit a hired band of ward politicians to invade our legislature assemblies for the purpose of influencing legislation, and the future wellfare of the state demands their full and complete retirement from public or private notice. Will the California assembly purge itself of these abdominable characters?

HOME SICKNESS.

When conditions surround a farm home which are unfriendly to the better nature of its occupants, how can we expect children to feel an interest in it or to care what becomes of it.

In conversation with a farmer from Fresno recently he asked us this question: "What can I do to interest my boys in the farm and keep them on it?" In reply we asked him a series of questions, one of which was: "What inducement do you offer to interest your boys?" He frankly answered "that none in particular were offered." We then told him that boys are only men in embryo and that he himself would not stay on a farm if he had no interest in it. We all know that success results from personal interest in the work in hand, and in proportion as we feel that interest will we work for results. One of the surest methods of obtaining the best efforts of the boys and girls of the farm, is to educate them along agricultural lines. In nine out of ten homes the children are unintentionally forced to despise farming. A sprouting Irish potato shoot, shut up in a dark cellar, will reach out for the light shed through a window many feet away. Many thousand children in our farm homes are reaching blindly after the light of an education, falling in weak rays on that remote home from some distant town where children are trained by precept and example for the commercial and professional world.

These same children if encouraged to seek higher education in farm work would become lovers instead of despisers of rural life.

The poverty in many farm homes, the colorless daily routine in such homes, the despair of success and the total lack of interest in all matters pertaining to the farm, as found in the homes of many California farmers, may have their hope restored, the strength of a lost self-confidence established by a more liberal observation of farm life and by a determination to make the home life brighter and richer in the things peculiar to the farm home. Are not too many farmers striving to live the lives of others in other occupations, rather than their own lives? The time is now ripe in which the farmer should magnify his calling. By magnifying his calling, by enlightening his children, he will overcome their home sickness of farm life and fasten them to agriculture for all time.

Secretary Wilson, always optimistic on the future of agriculture, tells of an instance where a farmer opened a night school for farmer boys and girls, in a rural community, and began teaching them interesting things about animal and plant life. This man pointed his pupils to the beauties of rich fields, quoted authors on scientific farming, care of animal and plant life, etc. He walked in friendly conversation through some of these fields hand in hand with youth. He talked of physiology, geology and other sciences to children who could barely pronounce the hard words, and later placed science primers in their hands. He talked of life in the home and sought to quiet the restless ambitions of the older boys and girls. Soon he aroused their interest and they began to reach out for themselves, buy books and study them. It is worthy of note that all of his scholars have found farm life the most entertaining, the most beautiful station in life. This was an object lesson well worthy of being followed today. The secret of keeping boys and girls on the farm is to interest them, and that is not difficult if we begin when they are young.

$7500 CONGRESMEN.

An exchange says; "Now that Congressmen have raised their own salaries the people are going to send some $7500 men to Congress."

This is just what ought to be done. Heretofore men of brains and character have refused to accept the office of Congressman for the reason that the salary has been insufficient to make the office attractive.

Now that it is on a par with the Federal judges and is able to compensate men of intelligence and ability, a better class of representatives ought to be secured.

It is high time the country began weeding out second-rate Congressman, who have rattled around in the seats of Thad. Stephens. James A. Garfield and James G. Blaine for these many years, and in their places seat men of brains and high character, who are imbued with the old time rugged honesty of the type of Andrew Jackson. Such men would never have permitted Standard Oil, nor railroad corruptionist's to acquire the hold on the country that exists today. We ought to begin right here in California to select our best men for Congressmen, and the work cannot be started too soon.

BUDDING OVER OLD TREES.

(Continued from page 238.)

ject a trifle beyond the bud, thus forming a protection to it.

The bands are usually left on the buds for about a month. If the spring is warm and with little chilly weather this is sufficient, but with the other kind of weather, the bands should be left on fully six weks. A heavy loss will surely follow if this last precaution is not observed when weather conditions warrant it.

After Care.

At the time of removing the bands, it can be definitely determined what percentage of buds will grow. If the leaf stem falls out when rubbed with the finger, leaving a fresh surface, such buds will start. A little experience will soon enable a person to detect at a glance, those buds which will not grow.

If the stand of buds is good, saw the branches off about an inch above the buds, wax the ends at once with grafting wax and whitewash the entire tree, branches and all, from the top to the ground. In a short time, the buds will start to grow as will suckers or sprouts from all over the trunk. These sprouts below the buds, should be pinched after two or three leaves come out on them and should not be allowed to grow any more.

When the buds have grown about eight or ten inches long, they should be pinched. This will cause them to branch and the wood to harden so that the wind will not blow them out.

After the second growth of the buds is about a foot long, it should be topped again so that the wood will harden some more and also prevent them from becoming top heavy. It is important not to allow any sprout below the buds to overgrow the buds. It will injure them by taking the sap away from them and will also interfere with their proper growth if allowed to grow up around them.

The sprouts are useful at the start in aiding the flow of sap to as near the normal condition as possible. Afterward the flow of sap should be directed to the buds and the sprouts removed.

The Following Winter.

The care of the buds during the following winter is a very important matter. Should the tops freeze down during that period, nothing will save the tree. The only thing left to do will be to dig the trees out and plant young ones. The orange seems to be able to make one good start after being beheaded, but when the head is cut off by frost the following season, the last chance for it to make a new tree is gone.

Protection is best afforded by wrapping with palm leaves, nailing the stems onto the trunks of the trees with eight-penny nails, and tying the tops of the palm leaves around the new growth of buds, leaving the tips of the bud growth projecting if they so incline.

By placing two nails in each palm leaf stem, and wrapping with shook rope, the palm leaves will serve as a protection against frost and a brace against wind. After the second summer, the buds should be able to go on without protection. There are some growers who girdle the branches above the buds when taking off the bands and leave the tops on as a protection against frost and wind during the first winter.

This is better than giving no protection, but the buds do not make as much growth the first summer as when the entire top is removed at the beginning of the first season. We have in mind cases where the budders left the tops on for a month after removing the bands. It takes at least two years for such trees to catch up (perhaps longer) with trees topped at the time of removing the bands.

The main branches, when long, are most desirable to bud into, but if laterals branch reasonably near the main trunk, these should be utilized as they leave a smaller stump to heal over. Buds should be inserted about an inch and a half apart in a ring about the branches.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Rain at Claremont to March 1st, 19.46 inches.

San Jacinto has had, to March, 14.47 inches of rain.

The pepper growers at Anaheim have formed an association.

The valley about Oxnard shipped 35 carloads of honey in 1906.

This season over 100 sacks of seed potatoes have been planted at Brawley.

San Fernando ranchers shipped a whole train load of hay to Los Angeles last week.

A number of cantaloupe growers met and organized the El Centro Fancy Melon Growers' Association.

The total rainfall for the season at Anaheim, is 16.02 inches, as against an even 10 inches last year to date.

Almost 1800 acres of land have been planted to beets on the Bixby Land Company's property to the northeast of Long Beach.

The celery crop of 1906-07 will soon be a thing of the past. Three weeks more at most will clean up all the remaining celery in the fields.

The shipment form Escondido for the week were 194 cases of eggs, 1540 pounds of chickens, 1620 pounds of cream, and 605 pounds of butter.

It is stated that a rancher near Huntington Beach who recently sent in the last of his eight-acre crop of tomatoes, finds that he has netted over $1000.

Two and a half inches of rain fell at Glen Helen ranch in Canjon pass during the last storm. This makes a total for the season at the ranch of thirty-one inches.

The Bixby ranch near Los Angeles, consists of over 6000 acres. About 2000 acres are planted to alfalfa, 2000 to barley and the remainder of the place is given over to garden truck and dairy products.

HORTICULTURE.

The total rainfall at Pomona is now 22.15 inches.

The total rainfall for the season at Lancaster is 12.80.

Orange has had 13.60 inches of rainfall to March 1st.

Total rainfall for the season at Fairmont 22.79 inches.

The shipment of citrus fruit from here the past week was 14 cars.

East Highland has shipped about 300 cars of oranges to March 1st.

A number of tracts of oranges are being set out in the Coachella Valley.

A total for the season of 21.37 inches of rain is recorded at Chino to March 1st.

The shipments of citrus fruits from Highland up to March 1st, were 336 cars.

An orange orchard of 40 acres will be planted by F. A. Tetley of Riverside at his ranch near Heber.

F. A. Powell of San Fernando shipped four carloads of olive wood to Los Angeles last week.

The rain of the past week added nearly two inches more to the record at Ontario, making 19 inches for the season.

The rainfall for last week at Escondido was .52 of an inch, making 1.60 inches for the month and 13.70 for the season.

Colton Fruit Exchange has made public its Christmas pool on oranges. The grower got $2.00 for fancy and $1.20 for choice.

The San Joaquin Fruit Company is completeing the fourth artesian well in its fine water system which will irrigate 1000 acres of land.

The government forest rangers near Redlands, working in the mountain reserve, have just completed the planting of 35,000 young pine, spruce and fir trees in various sections of the depleted reserve.

Northern California

AGRICULTURE.

The rainfall for the last storm at Watsonville has brought the season's total up to 28.61 inches.

Strawberries and potatoes are going to form a very large part of Siskiyou county's product for 1907.

There will be Farmers' Institutes as follows: Escondido, March, 26-27; Oceanside, , March, 28; La Mesa, March, 29-30.

Frank Blakeley, of Lemoore, states that he has something like 2000 acres yet to sow to wheat and in all will seed about 4000 acres.

H. S. Mammond, government veterinarian, has arrived at Sacramento yesterday to investigate the strange fatality among the sheep.

An epidemic has broken out among the sheep a few miles west of Orland, and so far no one has been able to determine what the disease is.

The rainfall for this season at Yuba City is above the average. The storm last week registered .95 of an inch, making for the season 18.98 inches, against 12.82 to a corresponding date last year.

Holstein cow transfers: Donne Crane, Legend Ora Pina, Ontray, R. M. Holtaling to F. Vile, Gilroy. Frau Korndyke, R. M. Hotaling to R. N. Burgess, Oakland. Meg Korndyke, R. M. Hotaling to J. H. Harlan Company, Woodland.

Holstein bull transfers: Belle Korndyke Butter Boy, R. M. Hotaling to Montgomery Baggs, San Francisco. Cardoza Choice, J. C. Thorn Jr. to Jos. Cardoza, Poplar. Eusebia De Kol Butter Boy of Magda, Chas. J. Welch to Oakland Sanitary Dairy Company, Oakland. Netherland Korndyke Butter Boy, Chas. J. Welch to Oakland Sanitary Dairy Company, Oakland. Romero Paul De Kol, Chas. J. Welch to J. C. Long, Kerman. Sir Fidessa Lyons, R. M. Hotaling to Montgomery Baggs, San Francisco.

HORTICULTURE.

The rainfall at Dinuba to date is 10.52 inches.

Season's rainfall at King City to date, 14.31 inches.

Total rainfall at Dinuba 11.06. To same date dast year, 7.02

There is a scheme on foot for reclaiming 85,000 acres in the Sulter basin.

The second annual citrus fair in Tulare county, will be held in Lindsay this fall.

Pear blight in the Sacramento valley, and especially in Sacramento county, is well under control.

Hotle Brothers, of Sebastopol, intend to have the largest Gravenstein apple orchard in this section of the state.

Offers of $7.50 per ton for tomatoes, have already been made in Sacramento and the price will probably go higher.

Eight thousand acres of land, near Terra Bella, suitable for oranges will soon be subdivided and placed on the market in small tracts.

The tree and vine planting in Sutter county will soon be finished for this season, and there has been more activity in this line than for many years past.

Apricots are in full bloom and, with ordinary weather, and no set backs, we shall have a good crop of this fruit. Almonds are already setting, and cherries are coming out. The season has so far been excellent for fruit

The rainfall for Redding for the present season will exceed that of last year by many inches if the present record is kept up. During the twenty-four hours ending at 7 o'clock Friday morning the precipitation was .70 of an inch. This brings the season's precipitation up to 26.78 inches, against 15.23 inches at even date last year.

An Opportunity to Make Money

MANY lines of horticulure have proved money-makers in California. The cherry, the Bartlett pear, asparagus, celery, the Washington navel orange and many other products have all brought millions of money to the state and besides induced many an Easterner tired of the cold of Eastern winters to come to this state where money-making opportunities exist with more livable conditions. Sometimes, through lack of understanding of conditions, indifferent success has been given to some of those soil tillers. More often a complete success has been secured.

To see the range of these products of the soil extended so as to give more opportunity to the newcomer as well as to the farmer already here, gives pleasure to every well-wisher of the state. For that reason much space has been given to making known the merits of anything which looks toward greater wealth producing power. The latest of these money-makers to be introduced are the improved forms of rhubarb, brought first to the attention of growers by Mr. Luther Burbank and propagated and distributed largely by Mr. J. B. Wagner of Pasadena.

We have often referred to Mr. Wagner's success with the Crimson Winter Rhubarb, and, further to his remarkable successes with a new and much improved variety now known as "Wagner's Giant." This latter variety is as yet not ready for distributing, as formerly explained, but improved forms of the Crimson Winter are in Mr. Wagner's experiment grounds, which he can now send out in large quantities.

J. B. Wagner, showing a rhubarb plant eleven months old, with a root more than four feet long. Also showing bunch of stems 18, 28 and 34 inches long.

Many large plantings have been made from Mr. Wagner's nursery and in almost every case the first year's output has more than paid for the cost of the plants.

In fact Mr. Wagner will supply plants sufficient for any large planting on a contract to take for his pay the first year's output, or a half of each of the first two year's output. In other words he shows his faith in his own goods.

The plants may be planted 1½x5 feet, which makes 5800 plants to the acre, which allows plenty of space to cultivate between rows. A nice sandy loam is best, but the plants have shown wonderful adaptability to almost any condition with which they have to do.

The greatest factor is, get good plants, well grown, of known pedigree; then fair care will bring wonderful results. Growers frequently net $1000 to $1200 per acre; under ordinary conditions it is safe to expect from $600 to $800 per acre first year, and better returns in after years.

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

TURKEYS.

I HAVE some letters in my mail box this week the replies to which may interest others as well as the writers.

One writes. "I wish you would tell us something about raising turkeys. Is it too early to set turkey eggs? I have no hens wanting to sit, and I do not know if turkey eggs can be hatched in an incubator and if the turkeys can be raised in a brooder?"

Young Turkeys Delicate.

Turkeys are considered to be very delicate little things when they are young, but are quite hardy after they mature or "sport the red" as it is commonly called. This comes between the ages of two to four months according to the season and according to the way they have been cared for and fed.

I lived for some years in the land of the wild turkey, and there I learned many things about raising the tame turkeys, and found that after all, in raising all fowls artificially, the nearer we can copy Nature, the greater will be our success. Let us see how she brings up her young turkeys.

The haunts of the wild turkey are always near fresh water, usually a fresh spring on a hillside or a running creek, and they never wander far from this. This is our first lesson. A supply of pure fresh water is absolutely necessary. It must be clean and pure, sheltered from the sun and so placed that they cannot get into it. I have lost several from their getting into the wash-tub or the stable bucket left with water in it.

Proper Food and Drink.

Drinking fountains can be bought at any cost at the poultry supply stores, or an excellent little fountain can be made out of a tomato can.

Make a nail hole about three-fourths of an inch from the edge, or cut a notch half an inch deep in the edge, fill the can with water up to the nail hole, put a saucer over it and quickly invert it holding the saucer tightly to the can. The water will leak through the hole into the saucer and the little birds cannot get into it to wet or drown themselves.

Young turkeys will not eat for twenty-four to thirty-six hours after hatching, and no food should be offered to them the first day. The mother must be fed. If the nest in which the little turkeys are hatched is so situated that I can put a small pen in front of it, I leave them there a few days, if not, I move them to a suitable place.

The young must have grit as their first food, for they will soon have bowel trouble if food is given them before they have "teeth" to grind it. Lice are enemies to little turkeys. Before giving the little poults to the mother, or putting them into the brooder, I dust them well with "Buhach" or "insectonos" and I continue to do this once a week until they are too large to handle.

Look for lice on the head and on the quill feathers on the wing and rub the powder well into them. Lice and over-feeding kills thousands of little turkeys every year, they are the two great causes of mortality amongst young turkeys.

Lessons From Nature.

When I lived in the land of the wild turkeys, I learned many things that were new to me, and especially about feeding the little tame turkeys. One thing was that they require very little food at first; in fact if they are under-fed they will grow bigger and stronger than if over-fed.

I was told there never to feed corn, cracked corn or corn-meal until they had "sported the red;" that is, until they showed red on the neck and head. The reason given for not feeding corn was that it would sour on their stomachs.

I have since found that corn (either cracked corn or raw corn-meal) does not become softened or partly digested in the crop, but passes to the gizzard in its hard state, and before the gizzard has time to grind it up, it ferments, bowel trouble ensues, followed frequently by death. So I avoid corn.

The First Food.

The first food is chick grit or coarse sand and a drink of milk (sweet skim) or water. Then when they are twenty-four hours old I put new laid eggs in cold water and boil they twenty minutes, chop them up finely shell and all, add equal parts of dry bread crumbs, and feed this dry, taking away what they leave and feeding the mother separately.

The next day I feed the same, but add very finely chopped lettuce, or dandelion or green mustard leaves and tender onion tops. This is their breakfast and supper. For dinner they have a little curd (Dutch cheese) made from clabber milk.

In a few days I add a little cracked wheat to their supper, and frequently, if short of bread crumbs, add rolled breakfast oats to the egg and onion. I always chop up one onion a day with the egg and bread crumbs unless the tops are very tender. I know of a man who raised his turkeys on an exclusive diet of onion tops and Dutch cheese and they did well. Onions are very healthy food for both chickens and turkeys; they prevent worms and gapes and cure colds, so I use them very freely.

When they are a few days old, I commence to add wheat to their food and at two weeks I gradually arrive at giving them wheat and rolled oats for breakfast, in the middle of the forenoon a head of lettuce to tear up; at noon, Dutch cheese, and about four o'clock their supper of egg, bread crumbs or rolled oats, lettuce and always an onion chopped fine.

Milk they have at least once a day, milk sweet or clabber, or curd seems to suit them well. I suppose it partly supplies the place of the insects and worms they would find in the wild state.

Causes of Mortality.

The two chief causes of mortality in turkeys, over-feeding and lice, can be easily avoided. Over-feeding kills more turkeys than do lice, and if it does not kill them, it stunts their growth, but unfortunately until they begin to die at five or six weeks of age, one scarcely realizes they have been over-fed.

They have voracious appetites and if the food is left before them they will eat too much and it takes only a few weeks for them to eat themselves into their graves. In the wild state they hunt for their food and take it leisurely.

They find just one grain at a time; just what they can digest slowly, and only enough goes into the circulation to keep them in perfect health, without over-taxing the digestive organs and the liver. The mortality among turkeys, especially among young turkeys, is chiefly from liver complaint brought on by over-feeding.

Turkeys require plenty of fresh air, but no draughts, keep them in a coop, if a coop is necessary, with one side entirely open, but let that side be away from your night breeze, and make the rest of the coop air-tight, and when they commence to roost, let them roost in an open shed. Trees are their favorite roosting places, but if you fear night marauders, a shed will do as well.

General Directions and Precautions.

I want to emphasize that little turkeys must have green food in abundance; they should have it at almost every meal, chopped with the other food and if possible, should be brought up free or on a clover lawn. I have gone into these minute particulars because I never lose a turkey after they are hatched, except by accident, such as having their heads crushed in a brooder, or getting drowned in the stable pail or cows' water-trough.

I am writing this in answer to a farmer who wishes to raise a few turkeys. Turkeys can be raised in brooders. I have done so myself for many years, but they must not

White Wyandottes
EXCLUSIVELY

The Reliable Strain triumphant over all

At the L. A. C. P. A. Show
January 7th to 12th we won

1st Cock ***2nd Cockerel***

J. E. Beadle 901 St. Louis St., Los Angeles, Cal.

When writing advertisers mention Cultivator

be in the same brooder with chickens or ducks. They can also be hatched in an incubator, but I prefer to hatch under hens, and to have the turkey hen mother them. My reason for preferring a turkey hen is, that she will never allow them to over-eat.

She will take a few mouthfuls herself, then walk away slowly from the food, calling them to follow her while a fussy good old Plymouth Rock hen will call them up and feed them till every little turkey is stuffed full, with the result that they are over-fed. So in feeding little turkeys mothered by a chicken hen, I am very careful never to leave food before them.

Califronia's beautiful valleys are wonderfully adapted to turkey raising, and I do not see why there are not more large ranches of turkeys like that of Mr. Dan Myers of Hemet, in the San Jacinto valley. He keeps about 1500, turns them out with turkey mothers when they are about ten days old, and lets them "rustle for their living" in his broad wheat fields. His turkeys are never sick, never have liver trouble, are easy to raise and bring in a good income for the holidays.

THE WHITE WYANDOTTE.

How often have I been asked by persons starting in the poultry business, "What breed would you advise me to start with?" My answer has invariably been "The White Wyandotte, the business hen of the 20th Century." When asked to give my reasons for putting the "Bird of Curves" ahead of the other standard varieties, I can tate them in a few words, and with your kind permission will give them in the columns of your valued paper, hoping that this article may be read by some brothers or sisters who are making up their minds on this most important question.

Having been born and brought up on a farm away back in rock-ribbed New England, I have had the handling of fowls ever since I could get around and feed them. It was not until 1888, however, that I took any interest in the "Fancy" and started that year with a pen of Golden Wyandottes. I bred this variety exclusively until 1892 when I went into the poultry business exclusively, and raised Light Brahmas, Black Langshans, Barred Rocks, Brown Leghorns, Black Minorcas and Golden and White Wyandottes.

We must all acknowledge that the above breeds are good fowls and have many good points, but after some years of experimenting and thoroughly tying them all out, I weeded out the different breeds until the White Wyandottes stood out alone, pre-eminent, as being the "Business Hen of the Twentieth Centry." Since that time I have been loyal to this variety of the popular Wyandotte family, and I feel quite safe in saying that there are more fanciers raising White Wyandottes today than any other variety unless I except the Barred Rock.

When in Boston a few years ago I had quite a talk with a prominent broiler man who told me that he had raised the Barred Rock and White Wyandotte side by side for years, but finally discarded the Rock and now raises the White Wyandotte exclusively, as he found that they matured earlier for the market than the Rocks. He said "If you try to raise Rocks and Wyandottes in the same pen, the experiment will prove to you that the Rocks will go clear off their legs, while the deep-breasted,-plump bodied, smooth-skinned, active little Wyandottes will take their medicine five times a day and grow like weeds on it." My own experience has been that they grow faster, have a steady growth (and not by fits and starts as some other breeds do, which grow awhile, stop and take on a coat of feathers, and then fill out) but they keep right on growing all the time, and are always plump and compact, instead of slim and "gawky" as the Rocks are.

With all due respect to our brother fanciers who pin their faith on the Rocks, both White and Barred, I am sure that way down in their hearts they will acknowledge that the Wyandotte has by far the more beautiful shape of the two. As broilers, fryers

Chicks Just Hatched
We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.
Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.
CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

Don't Be Humbugged or Fooled

WHEN you buy your chick food remember A. C. W. is made here in Los Angeles and has been for years. Its success has been won by merit. A. C. W. is in sealed packages. We do not claim the only chick food or the best food on the market.—Cheap talk—anyone can say that. What we do claim and say is that A. C. W. chick food is so prepared that young chicks, no matter how young, can digest it easily, preventing bowel trouble. The kinds of grain and proportions used are such that chicks thrive in a healthy, natural manner; no dope or drug in A. C. W. We have followed nature and gone her one better in the composition of A. C. W. Then when you buy 100 lbs. of A. C. W. chick food and feed it, you have no waste. Did you ever stop and figure that you must add the waste to the original cost of your food. In many of the cheap, (?) so-called chick foods, the waste runs as high as 33 1-3 per cent. That means you actually pay 33 1-3 per cent. more for your food, or in other words you get 66 2-3 lbs. of food in 100-lb. sack. In A. C. W. you buy 100 lbs and get 100 lbs and your chicks eat 100 lbs. We claim this is a cheap food. Try a sample order of your dealer or send to us and you will be convinced that at last there is a chick food that is mixed right, priced right, waste is right as there is none—in fact it fills the bill—of the chick

Bred and Raised on My Ranch

Baldwin's White Leghorns

Baldwin's Leghorns are all right in blood lines and for heavy laying right straight through the year they are unexcelled. I breed nothing but White Leghorns and make them a study, aiming at quality and market value combined.

My yards are modern in every respect and I invite inspection. Think of us when you think of White Leghorns.

My best pens are made up of stock from the first prize winners at the great show at Madison Square Garden, New York, 1905 and '06.

All stock sold on a guarantee to be as represented.

Eggs. $1.50, $2.00, $3.00 and $5.00 per setting (15). Incubator lots, $6.00 and $10.00 per 100. My $6.00 eggs are from selected yards. My $10.00 eggs are from especially selected matings of my finest birds.

Send for catalogue giving full description and prices of my matings and show records.

MY EXHIBIT OF
WHITE, BUFF AND PARTRIDGE **Wyandottes**
Won 26 Ribbons and Special Prizes at the Poultry Breeders' Show, 1907
R. D. Box D27 L. E. BERKEY, Fullerton, Cal.

and roasters when young, and layers and mothers when grown, they cannot be excelled by any breed.

The shape that the standard of perfection requires for the Wyandotte family is one that I consider as near perfection as one can see in a fowl, and I fail to see where it can be improved. It is the "Bird of Beauty" and of curves. It catches the eye of anyone whether he be a chicken "crank" or not, whether seen in the show room or the breeding pen. While the standard does not call for a Wyandotte shape in a Rock, yet I have noticed that one with a Wyandotte shape presents a pleasing appearance and is greatly admired. "Why is this?" you ask, and the only answer we can give is that it gives to the bird that fullness and compactness of form that is possessed by no other breed.

It is rather a difficult task to find words to describe the Wyandotte shape, although the word "blocky" expresses it better than any other word I can use. This distinct shape is very striking even when the chick is first hatched and stays with it to maturity. Ever since I first raised Wyandottes I have felt that they came nearer to having the ideal shape than any other breed, and as time goes by and they are bred nearer and nearer to perfection, it seems to me that they will eventually become the most popular fowl in the whole catalogue of birds.

The close rose comb is another splendid feature of the Wyandotte family, and gives to the head a very pleasing appearance, such as a high single comb could not give. In the East where I made my first venture in the poultry business, the comb was a great consideration on account of the extreme cold weather nipping the large combed varieties and putting them out of business. In this great and glorious climate the cold weather does not enter into the matter at all, but still there is a beauty about a neat rose comb that I cannot see in a single comb.

One of the best points about them, and one that will appeal to anyone who is raising chickens or contemplating starting in the business, is their ability to lay good sized eggs all the year around, instead of certain seasons. I can truthfully say that I get nearly as many eggs during the fall and winter as I do during the spring and summer, when eggs are plentiful with everyone, and this without feeding to force egg production. It is for the above reasons that I will back up the White Wyandotte as being the best all-purpose fowl in existence today. They are easy to breed, and with proper mating one gets fewer culls than in any of the particolored breeds. As egg-producers they cannot be beaten even by the vaunted Leghorns, and when size is considered the latter variety is clear out of the running.

What a beautiful picture a flock of White Wyandottes make on a piece of green lawn! Surely they cannot help but fill the bill and please even the most critical chicken fancier.

A great many people rush into the "chicken business" with little if any previous experience, except what they have gained from books, intending to raise a great many varieties, do things on a large scale and make barrels of money. They can see no way for failure to overtake them and (on paper) they figure out their profits. Alas! what an awakening comes to their dream of "easy money" for it does not take many months to have a rude awakening and they find too late, that their dream is o'er, and there is no "easy money' in the poultry business. Perhaps a small per cent. of them succeed, but it is a very small one, and even these do not succeed until they have gone through the great school of experience, for which they have paid dearly in a great depletion of their pocketsbooks and many hard knocks.

How much better it would have been for them to have started in a small way, learning the details of the business (which can only be mastered by experience, and then gradually increase as success and practical knowledge come to them.

My advice to new beginners is to go over the ground carefully, pick out the breed that appeals to you most (be sure it is the Wyandotte and you will make no mistake) get some good birds and study them from every standpoint, until you know them thoroughly. Then it will be time to increase and branch out into the business. It is in this way only that people can succeed in this most fascinating of occupations.

Now then, fellow fanciers who swear by the Rocks, Orpingtons, Leghorns etc., let us hear from you as to why you do not drop these breeds and take up the "Bird of Curves" the business hen of the 20th century. I have endeavord to present a few reasons why the Wyandottes are the best all-purpose fowl and I hope sincerely that they may have some weight with the new beginner. I will be glad to hear from any of the readers of the Cultivator, and will be glad to give advice on any subject akin to the breeding, feeding and general care of the birds.

In some future number I will take great pleasure in telling the readers of the Cultivator how I mate my breeding pens for special results, as I am breeding the "stocky," short legged kind that lay, pay and stay. Let us hear from the rest of the boys and the ladies as well on their favorite breeds.—F. A. Mason, Los Angeles.

The cassowary is a bird
That's hard to capture, very.
Folk hunting for her plumes have made
The cassowary wary.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Lombardy Poplars.

If the subscriber from Modesto who inquired last week regarding the best tree to plant for wind breaks will plant "Lombardy poplar," he will find a most valuable addition to his farm. They make the most rapid growth and supply fuel and posts in from two to three years. I have tried several other kinds. The Lombardy poplar has proven the most satisfactory. I have over five hundred on my twenty acre farm.

All my poultry fences, corrals and fence enclosing the twenty acres are Lombardy poplars. I put in the posts any time from December to March 1. Every one makes a growth of from seven to ten feet the first year. They furnish me in wood and I will have posts and wood to sell after this year. I cut the trees for posts six feet from the ground when they are four inches in diameter, taking care to leave a few limbs on the stumps, also on the posts. Those make small trees to plant the next year. If the soil is not heavy clay, an ordinary crow bar is all that is required to make the holes for planting.—Subscriber.

Weak Pins.

Bought a couple of female shoats about six months old a few weeks ago, kept them in pen which I moved on to fresh ground every few days, and fed skimmed milk, sweet and clabbered. One of them has lost use of hind legs; can't stand on them, but drags them. Have turned her out on green feed, and have reduced her amount of milk as seemed so fat, thought that might have caused trouble. Can you give me any light on the subject, as to cause, treatment, and if there is a possibility of cure.—A. B. N., Dos Palos.

The trouble with pigs breaking down behind is common and is said to be due to lack of phosphorus in their food. The experiment station advises feeding a tablespoonful of ground bone daily as a preventive. The pigs affected may be relieved by using a stong liniment on the back. Practically I believe in using up the pig for pork at once, and in breeding away from the trouble. Any sows from litters that show this trouble are discarded as breeders.—M. E. S.

To Dry Mushrooms.

Wipe them clean, take away the brown part, and peel off the skin. Lay them on sheets of paper to dry, in a cool oven, when they will shrivel considerably.

Keep them in paper bags which hang in a dry place. When wanted for use, put them into cold gravy, bring them gradually to simmer, and it will be found that they will regain nearly their usual size.—M. Greenhalzh. Corning, California.

Cotton-Tail Rabbits.

Please tell me how to destroy the cotton-tail rabbit, the worst pest I have in my vegetable garden.—R. I. Fullerton.

We do not know of any satisfactory way to destroy cotton-tail rabbits. Probably the best plan to protect the garden is to fence it with ordinary chicken netting. The rabbits will seldom get over netting two feet high.

Indian Runner Ducks.

Will you please give me the name of party that made inquiry in the last week's Cultivator, concerning a market for Indian Runner duck eggs, only the initials were given.—Mrs. Isaac Martin, Merle, California.

Correspondent please communicate.

Every farmer's family needs a good, reliable revolver for protection against burglars and sneak thieves, a good, accurate, reliable shot-gun for field hunting, and a good single-shot rifle for killing hogs, beeves, muttons, etc. Every farmer needing a fire-arm of any kind should send to The Hopkins & Allen Arms Co., 121 Franklin St., Norwich, Conn., for free copy of their big, new "Gun Guide and Catalog" for 1907. It gives best prices on all kinds of fire-arms and tells how to pick out a shot-gun, rifle or revolver so as to get the best value for your money.

Hopkins & Allen fire-arms are superior in quality and material, and sold at lowest prices.

NOTICE TO MY BARRED ROCK PATRONS:

On January 10th, 1907, I assigned over to H. T. McCULLOUGH, of Monrovia., Cal., all my right, title and interest in the Arrowhead Strain of Barred Plymouth Rocks. Hence, the McCULLOUGH POULTRY FARM is the only one that can supply eggs and stock direct from the original birds and from matings made, personally, by me, to produce high-brade breeding and exhibition specimens. Thanking my many fancier friends, patrons and the public for their trade, and bespeaking for my successors a continuance of their valued favors. I remain, Fraternally yours, **S. M. BUTLER.**

Legal Queries

Answered by L. M. FALL, Esq.
204 Frost Bldg., Los Angeles, Cal.

This department is edited by a practicing lawyer, who has had years of experience at the bar. He will give accurate and reliable answers to all legal questions when they are of sufficient importance to be of practical interest to any considerable number of our readers.—Ed.

Damage by Kick.

My neighbor's horse broke into my pasture recently and kicked a colt, rendering it useless for all time. The break in the fence is on my neighbor's part of the line and I had notified him to repair it before the accident occurred. Can I recover damages?—E. B. W., Bakersfield.

Yes. The full value of the animal.

Keeping School Fire, Etc.

I am a teacher in a country district. I have to make fires, carry coal and wood (when I can get them) sweep the school house, etc. I did not agree to do this work when I hired as teacher. Can I collect for this extra labor outside my regular salary?—A. P. J., Santa Paula.

You can only collect under your contract for services rendered as a teacher. You may also be employed to do janitor work in addition, but to do janitor work voluntarily entitles you to no compensation. See the authorities and arrange for the additional services.

Water Rights.

I bought ten acres of land from a company which is selling the land conveying water rights with it. But the deed does not specify what those rights are. What is meant by ordinary water rights that go with land sales? If no shares of water are named in the deed, and the term "subject to water rights" is used, what does it mean?—J. B. A., Upland.

"Water rights" in a deed means that the owner of the land has stock in an irrigation company entitling him to a certain amount of water from that company, per month, according to the amount of stock he has in the company. When such land is conveyed this stock is presumed to go with the land, but it does not necessarily do so. The water rights may be sold separate from the land, like any other stock.

Distributing an Estate.

Please tell me how I can make provision at my death of my property to avoid the expense and delay of probate proceedings? Will a deed, or will, render public probating unnecessary?—P. V. S., Colegrove.

All wills must be probated. The only safe way to dispose of personal property is by will. A will may be changed at any time before the death of the testator. Sometimes deeds to real property are executed and placed in escrow to take effect on death of grantor, in which case title vests immediately in grantee, qualified only by life tenancy in the grantor. This is not always safe. It often results in litigation.

Judges' Salaries.

Please state what salary judges of the several courts in California receive.—Student, Pomona.

Judges of the Supreme Court receive $8000.

Judges of the Appellate Courts receive $7000.

Judges of the Superior Courts of the different counties receive different salaries, fixed by the legislature, based upon population and amount of business. Los Angeles Superior Court judges now receive $5000. This amount will probably be increased to $6000 under a bill now before the legislature.

Wife's Dower.

When a married man dies in Kansas without a will, having property there where son lives, and having property also in California where he resided at time of death; what portion of his estate in these two states does his widow get?—Martha B. J., San Diego.

If there is but one child the widow inherits the one-half of the property in each state.

Citrus Deciduous Ornamental **TREES** Vines Palms Roses

And Every One True to Name

We Are Universal Providers for Orchards and Gardens

We do not confine ourselves to fruit trees alone, but grow also an immense assortment of ornamental trees and shrubs, climbing and trailing plants, palms for house decorations and outside planting, roses in tree and bush form.

APRICOTS

Write us for prices on Blenheim, Hemskirke, Royal and Tilton Apricots. The last named is one of the best canning, drying and shipping cots on the market today. Our stock of this later variety is exceptionally fine, and our prices will be sure to appeal to you.

PEACHES NECTARINES

Among the standards on hand still in quantities, we have Elbertas and Tuscan Clings, and other leading sorts in limited supply. Also a fine stock of Stanwick Nectarines, the leading variety, on which we are prepared to make special inducements.

APPLES AND PEARS.

The leading varieties are becoming depleted fast, but we still have the following standards in stock:—Gano, Jonathan, Smith's Cider, Yellow Newton Pippin, Lawver and Spitzenburg.

In Pears: Bartlett, Beurre Hardy, and Winter Bartlett.

CHERRIES.

We are still in the position to supply Bing, Black Tartarian, and Royal Ann Cherries, and are prepared to offer special inducements in quantities.

ALMONDS.

If you want any I. X. L., Drake Seedling, Ne Plus Ultra Nonpareil Almonds, we think we can make it worth your while to place your order with us.

Calimyrna Figs

Our Great Specialty

None genuine without our seal attached to each bundle of trees

CALIMYRNA R FRESNO

GRAPEVINES

We can still furnish such leading wine grapes as Burger, Feher Zagos, Grenache, Sauvignon Vert and Trousseau, and in table and raisin varieties, Black Cornichon, Black Hamburg, Flame Tokay, Emperor, Thompson's Seedless. Also vines grafted on Phylloxera resistant roots and rooted Phylloxera resistant vines. Write for our complete surplus list.

CITRUS TREES.

If you want an assortment of varieties we can supply you with the leading kinds of Oranges, Lemons, Pomelos, Limes, Citrons, all grown in the great Thermal belt near Exeter, Tulare county.

OLIVES.

Our assortment of the leading oil and pickling varieties was never better. Our catalogue tells all about them.

BERRIES.

Mammoth and Loganberry plants. Extra fine well-rooted stock. The new Himalayan Giant Blackberry, introduced from Australia, is proving to be a great money getter in the San Joaquin Valley and the growers are enthusiastic over it. Stock limited. Price $10.00 per 100 for finely rooted tips.

ROSES.

We are still in the position to make up assortments of many of the leading and best sorts of roses. Let us send you a list of varieties still in stock.

BURBANK'S CREATIONS.

For the first time we are offering four of his latest and best creations, SANTA ROSA PLUM, RUTLAND PLUMCOT, PARADOX and ROYAL WALNUTS. Write for illustrated booklet telling all about them.

CATALOGUE AND PRICE LIST.

Our new catalogue is the finest book of its kind ever gotten out on the Pacific Coast. It is a compendium of valuable information and should be in the hands of every fruit grower and lover of the beautiful in nature. We also print a catalogue in Spanish. Catalogue and price list mailed on application.

General Agriculture

TO WHEAT GROWERS.

PROFESSOR G. W. SHAW of the University of California, who is in charge of the cereal investigations which are being made upon the station near Yuba City, has issued a preliminary report covering the progress made during the last two years. While the report is short it very strongly reminds the public of the great importance of improving both the quality and quantity of the present cereal crops of the state.

In his report Professor Shaw shows that could the present annual importations of over four million bushels of Eastern wheat be stopped and supply the milling trade entirely from California-grown wheat it would mean a saving to the people of the state of over $1.500,000 annually, and could the average production of California wheat be increased by even so small an amount as one bushel per acre there would be another $1,500,000 added to the agricultural resources of the state.

Two field stations of twenty acres each have been established, one at Yuba City and the other at Modesto, and a cereal laboratory equipped with the necessary appliances for complete practical, chemical, milling and baking tests has been established at the university.

As this work was begun early in 1904 it is yet too early to expect definite results, as experiments of this kind must be extended over a period of several years before all the experiments can be worked out.The experiments are being carried on under the following four plans:

First, the introduction of new varieties of wheat, oats and barley from other states and countries; second, the improvement of desirable new varieties by straight selection; third, the development of entirely new varieties by crossing high gluten wheats upon local stocks and following this by selective improvements; fourth, a line of special experiments dealing with numerous phases of cultural practice, including the advantages of change of seed, effect of fertilizer and rotation of crops on the yield per acre, effect of the time of cutting, methods of conservation of moisture in cereal culture, and numerous other factors.

Bills are now before the senate and assembly providing for an apropriation of $10,000 with which to continue these experiments for two years longer.

FARM WINDBREAKS.

The Norway spruce planted in open exposure as an ornamental evergreen has not generally given good satisfaction in the larger share of our State, the white spruce making a far more presentable appearance, holding its bright green color all the year round. For the same reason we have not felt like recommending this tree for windbreak planting, but have rather approved of the Scotch pine and other varieties that stand open exposure. However, some years ago we began planting a number of varieties of evergreens in a wood lot where the black oaks had begun to die and leave large vacant places. This planting was made irregularly with trees about two feet high without any cultivation or further care, other than to dig a hole sufficient for the roots of the tree. Of the varieties so planted we have found the Norway spruce, arbor vitae, white pine and balsam fir among the better kinds, the pines seeming to demand more light and room than such a space would give them. Of all the trees so planted the Norway spruce has held its own and made the best growth of any, many of them appearing almost as thrifty as if they had been under cultivation and held the ground alone, and give promise of making good timber in a shorter period than any other of the kinds planted. What little experience we have had with the Douglas spruce, it has also done well, and we are under the impression that this will prove a very valuable species in grove planting or reforesting.—N. D. Farmer.

CORN AND ALCOHOL.

E. W. Wagar has issued a pamphlet in which he takes the ground that denatured alcholol will force the price of corn up to $2 per bushel and corn land to $5000 per acre. This enthusiast says further:

"Corn is the greatest, readiest and the best producer of alcohol in the world. Alcohol is the best and cheapest available source of light, heat and motive power in the world. Light heat and motive power are the three agents closest allied to the civilization, development and advancement of the industrial world and the comfortable existence of mankind. Those who consider this funny will laugh; those who think it not true should sell the corn crop of 1906 short; but the farmer who disposes of nis corn below 40 cents at home is throwing away money."

AN EXTRAORDINARY SUCCESS.

A Scottish minister, taking his walk early in the morning, found one of his parishoners recumbent in a ditch.

"Where have you been the night, Andrew?" asked the minister.

"Weel, I dinna richtly ken," answered the prostrate one, "whether it was a wedding or a funeral, but whichever it was it was a most extraordinary success."

Tubb—I flatter myself that honesty is printed on my face. Grubb—Well—er—yes, perhaps—with some allowance for typrographical errors.

CORN CORN CORN CORN

Plant Eastern-Grown Seed Corn

Johnson & Musser Seed Co.

Up-to-Date Seed House

Iowa Silver Mine, Grown on the Rosemead Ranch by James Gooch from our Eastern-grown Seed.

We have just received our usual carload of Nebraska-grown hand-picked Seed Corn, and offer it at the following prices f.o.b. Los Angeles:

King of the Earliest, 85 days. The earliest Dent variety. Ears short, 12 to 16 rows, well filled. Grain long and yellow, making an extra quality meal. Per lb. 5c; 100 lbs. $3.50.

Improved Leaming, 90 Days. Ears are large and handsome, with deep, large grains; orange-yellow color and red cob. Per lb. 5c; 100 lbs. $3.50.

Pride of the North, 90 Days. One of the best sorts; ears have from 14 to 16 rows 8 to 10 inches in length, slightly tapering; color light orange. Per lb. 5c; 100 lbs. $3.50.

Minnesota King, 100 Days. A large-grained variety; yellow. Per lb. 5c; 100 lbs. $3.50.

Wisconsin White Dent, 90 Days. A perfect white Dent corn, of good quality, resembling the Leaming. Per lb. 5c; 100 lbs. $3.50.

Champion White Pearl, 90 Days. A fine white flint corn. Per. lb. 5c; 100 lbs. $3.50.

Early Mastedon. Having grown and sold the Early Mastedon corn four years, we recommend it as being decidedly the best of all Yellow Dent varieties. Every one who has seen it grow is enthusiastic in its praise. Large ears, deep grains, and as many as 24 rows on a cob. Eastern grown, per 100 lbs.$3.50.

The Iowa Silver Mine. A large White Dent. The grains are as large as the Hickory King, but longer, having a small cob. It is the most desirable of all White Dent varieties. Per 100 lbs. $3.50.

Red Cob, Ensilage. A large stalk with a profusion of leaves which makes it the most desirable for ensilage. Price, per 100 lbs. $3.50.

Stanford White Flint. An excellent White Flint corn. More prolific than the King Philip. It is an excellent extra early table corn. It has long ears and a small cob. Price, per lb. 5c; per 100 lbs. $3.50.

White Cap Yellow Dent. Exceedingly prolific and hardy, resisting drought much better than other varieties. Per 100 lbs. $3.50.

Reid's Yellow Dent. This is the variety that has been brought to a high state of perfection by the Illinois growers, and drew the medal at St. Louis because it averaged the greater number of pounds per bushel. Price, per 100 lbs. $3.50.

Kink Philip, 90 Days. A small yellow variety, very popular in this market. Price on application.

Hickory King, 110 Days. A white variety, having the largest grain with the smallest cob ever introduced in a white corn. Price on application.

Johnson & Musser Seed Co. 115 N. Main St., Los Angeles

ONLY RICH SOIL PAYS.

Your request reaches me two thousand miles from my Wisconsin home, at Pasadena, California. While conditions here are in many respects quite different from those in the Middle West, I find the effects of soil robbery as fairly apparent as in the older parts of this country. It seems to me that if the history of the agricultural invasion of this continent is written by some writer of the future, it will be described as the army of devastation which robbed the soil of its fertility, beginning on the shores of the Atlantic, marching on until stopped by the great Pacific, and then, like Napoleon, crying for more land to conquer.

Now, a people that have learned that land has a value and that there is no free land left for the despoilers, have been working to bring back this impoverished soil to a higher state of production.

In very many parts of the country where stock-growing is followed by a system of crop rotation the problem of soil improvement has been solved, but in many localities where the varieties of crops are limited and where truck and fruit crops are grown some other method of soil improvement must be followed.

The physical condition of the soil first needs attention, for there is usually a deficiency of humus, and this must be provided if we expect to grow profitable crops. Stable manures and cover crops provide for this most necessary element. Leguminous plants should be grown when posible for this purpose, so as to catch and hold the free nitrogen from the air, the most expensive and most needed element of fertility.

As the area used for fruit and truck growing increases, the demand for some form of a purchased fertility increases and a larger proportion of commercial fertilizer is used each succeeding year.

Sucessful growers of truck and fruit crops use an increased amount per acre each year, as they have learned that only the best fertilized acres pay a profit. We find this is particularly true in this land of sunshine, fruits and flowers. The men who are making money are the ones who are using fertilizers freely and to the extent that seems to some most prodigal.

Each year a larger number of farmers are obliged to depend upon the commercial fertilizers in growing their crops, and they should learn more about the quality of the goods they buy.

Too many simply know they are buying a "complete fertilizer" or a "super-phosphate" and do not know that these terms mean a matter of proportion rather than the amount of plant food.

The analysis formula printed on each sack instead of giving information, really mystifies the average buyer. The value of the solubles and the insolubles, or the available and the unavailable, are often misunderstood.

There is a large amount of refuse material used for a filler by our fertilizer manufacturers that should be burned to make steam rather than used to enrich the railroad companies and the manufacturers of gunny sacks.

The time has come when the successful cultivator of the soil must know what elements of plant food he needs for the growing of his crops, just as the successful dairyman has learned what elements and what proportions of food he needs to produce the best results.

Phosphoric acid may be purchased in the form of ground rock or bone; potash in the form of muriate or sulphate and applied separately or mixed.

Nitrogen in the form of nitrate of soda should be applied alone and in several applications during the growing season. Wonderful results are often secured in using this soluble element of fertility early in the season to give the young plants a start before the weather has become warm enough to form nitrates from the nitrogen in the soil.

By using these forms of fertilizers, the farmer will be able to experiment with different combinations and learn what he needs to grow his crops to the best advantage and economically.—D. Utter.

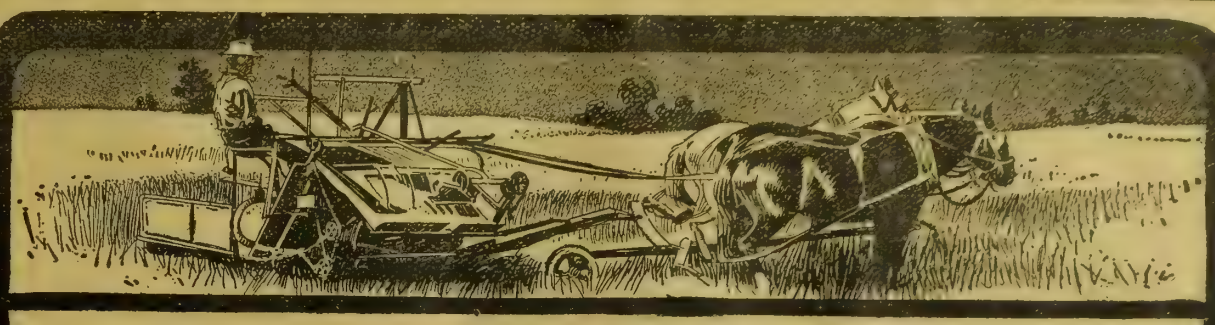
ALCOHOL MOTORS.

Alcohol is increasing in popularity as a motive power in Europe, particularly in Germany, where it is being widely used on the farm. It is convenient, safe and clean. It is reported that raw alcohol can be produced in Germany from potatoes for thirteen cents a gallon by processes so simple that the farmer can do it himself. Alcohol motors have been perfected and machinery for distilling improved, and the German government has encouraged the industry by removing the taxes from such alcohol as is used for technical purposes. —Country Life in America.

PURE WATER.

"The Pioner dreamed of the clear, cool spring gurgling from moss-grown rocks in the depths of the dell; the picturesque well sweep or creaking windlass, and the 'moss-covered bucket that hung in the well;' but both dreams have faded; for the spring is dried up, and in the well lurks a poison sweeter than poppies, deadlier than the nightshade.—McGee.

"What is the greatest danger encountered in running an automobile?" And without hestitation the chauffeur answered, "The police."



HARVEST IS COMING AGAIN ARE YOU READY?

To be sure, it's some time yet before the grain will be ready, but it won't be long before you'll be so busy with Spring work that you will have no time to get ready for harvest.

Now is the time to give this important matter serious consideration.

How did you get along last year?
Were there any delays or any break-downs?
Did you lose any grain?

Were you able to begin harvesting when your grain was just ready, and finish before it got too ripe?

How did your horses stand the work?

Think back now, and you can easily tell about how you are fixed for this year. If you are not prepared to harvest your grain quickly and easily, without danger of delay, it is time right now to take steps to prepare yourself. Now is when you have time to give the selection ot a machine the consideration you ought to give it.

When you buy a new harvesting or haying machine, you want to buy the right one. If you wait until Spring work is upon you, this important matter will be put off until the very last week before harvest, and you will have no time to investigate—no time to consider. You may even be forced to buy what you don't want. It is the part of wisdom to do this investigating now.

You know the International Harvester lines—

Champion, McCormick, Osborne, Deering, Milwaukee, Plano—

with any one of these you can do your harvesting right.

Four things are prominent in good farm machines of any kind: The principle is right; The materials are right; The workmanship is right; The record is right.

Now let us look into these things in connection with the International lines of harvesting and haying machines.

Since the invention of the self-binder, a great many different makes have been put on the market. Most of these failed to receive the approval of the American farmer. They were not built along right lines. Years ago the Champion, Deering, McCormick, Milwaukee, Osborne and Plano began to stand out from other harvesting machines, because of the correct principle back of them.

Time and experience have demonstrated that they were right; they embody all that is good that has been developed in 30 years, and there's no feature about them that is in any way untried.

So you are safe enough as to the underlying mechanical principle of any of these machines.

Now as to materials. The farmer buying an International machine may be sure that the material is **always the best.** Every bit of material—wood, steel, iron, malleables, paint, etc., is subject to the most rigid test and experiment before being used. Only large capital and a strong organization make these things possible, for in addition to the superior out-put of their own coal and iron mines, iron and steel mills, timber lands and saw mills, they give at all times a first choice from all the other material manufacturers of the entire country. The International Harvester Company affords a known market to every material manufacturer in the land if his product comes up to the high International standard. These are but a few of the many advantages which insure to the farmer the best of quality in every International machine he buys.

Next comes workmanship. The enormous demand for these six leading makes of harvesting machines enables the International Harvester Company to maintain manufacturing plants of the highest efficiency and to employ workmen of the highest skill—factories and workmen that could not possibly be maintained to supply the small demand that would come to an individual manufacturer.

Now comes the record. Practically every farmer in the United States knows of the satisfactory record of these machines. He knows that for the harvesting of all varieties of grain, light, heavy, standing, down or tangled, these machines have never faltered—have never left him in the lurch. He knows that they have stood up to the work well and have endured season after season.

He has gone to the harvest always with the perfect assurance of success. When in rare cases the unavoidable accident has occurred, he remembers that the repair parts are near at hand and that **they always fit.** Another advantage in purchasing International machines is that repair parts may be had at any time and any where.

Any one of these machines will do your harvesting right. Visit an International dealer and get whichever catalogue you want. If you don't know an International dealer, write to nearest branch house.

Balance in 3 Years

to secure a 10-acre orchard that will pay later on from $800.00 to $1000.00 net profit per year per acre.

Let us tell you how this can be done.

Absolute Security

for your investment and for large profits, is GUARANTEED in this the BEST ORANGE ORCHARD PROPOSITION ever offered. Your profits GUARANTEED by BOND and MORTGAGE on OTHER ORCHARDS of our own.

Only 200 acres will be sold in this way to advertise the tract of 3000 acres we are selling.

Frostless location, ABUNDANCE of cheap water, BEST CLIMATE AND SOIL in the whole State FOR ORANGES AND LEMONS.

Orchards 10 to 20 years old and clearing up to

$1,500 per Acre per Year

in this locality are proof positive of the value of our proposition.

Such an Opportunity

only comes once in a lifetime. Write or call NOW and let us

Show You.

We have the best proposition in the world for good, successful, responsible agents, who can SELL REAL ESTATE either on large salary or commission, or both, and we want the best representative obtainable in every city.

THIS MAY BE YOUR CHANCE.

It costs very little to write or interview us and LEARN of this UNPRECEDENTED chance to PROVIDE an EXCELLENT INCOME for the FUTURE, with COMPARATIVELY NO INVESTMENT of cash, and LITTLE TIME OR ATTENTION REQUIRED.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Mar. 6, 1907.

The receipts of butter yesterday were unusually heavy, amounting to 37,369 pounds. This is far above the amount needed to meet consumption and the increased supply eased the market decidedly. However, a change in the selling price is hardly looked for within the next two or three days as the rain will again curtail shipments from the north for a short time. Eventually the supply will be greatly increased as result of this rain, but a difference will not be noticeable until the weather again clears up.

Valley Creamery	67½
Coast, fy,	60
Cooking	23

Cheese

Cal. Young American, per lb	20
California Anchor	19
Cal 3-lb. hand	21
Northern	17
Domestic Swiss	20
Imported Swiss	29

Eggs and Poultry

The price of eggs went up one cent today, making official quotations of local ranch candled stock 20 cents and northern 19 cents. The advance is unusual at this time of year, but in the last two days few eggs have arrived owing to the heavy rain.

The supply of eggs is no heavier than it was at this time last year and demand has increased perceptibly which accounts for prices not declining more rapidly than they have.

Eggs, local, per doz.	20
Northern Candled	19
Fresh Eastern	18

The following are average prices which dealers pay to producers for live weight:

Hens, per lb	14
Young Roosters, per lb	16
Fryers	16
Broilers, per lb	18
Old Roosters	8
Turkeys	16@19
Geese	12
Ducks	12

Live Stock

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs, 200 lb	7.50
Prime Steers.	5.50
Heifers	4½
Calves, per lb	5
Sheep, ewes, per head	5.25
Lambs, per head	7.50
Wethers	5.50

Potatoes

Receipts of potatoes were heavier than on the day previous, but the increases was not sufficient to frighten dealers and the market was slightly improved. No spuds were sold during the call on the Los Angeles Produce Exchange, but the only offerings made were at a higher figure, an indication that the surplus of last week has about cleaned up.

Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.

This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us. Anyway send for circular with affidavit of above killing, and a few out of many testimonials.

We do not send less than 2 bottles.

Compounded under Bille's patent by

West Coast Stock Food Co.

818 San Fernando St. Through to Alameda St. Los Angeles, Cal.

Manufacturers of the celebrated West Coast Poultry Foods.

Send us the names of twelve persons who keep poultry and we will send you free "The Poultry Manual," by those high authorities, F. L. Sewell and Ida E. Tilson, profusely illustrated.

Eggs and Poultry

The demand for Poultry was decidedly small yesterday and fluctuations in prices showed few changes.

Citrus Market

During the past week the eastern citrus markets have yielded prices very satisfactory to the California shippers. All conditions have been favorable and consequently the market is very strong and yesterday's sales in New York, as given below, show prices slightly higher than for some time. The New York weather today (March 5) is extremely good—a little cloudy—but warm—good for citrus sales. Fifteen cars of oranges were sold today.

The following appeared lately in the agony column of a daily paper: "Dear Tom—Come immediately if you see this. If not, come on Saturday."

When writing advertisers mention Cultivator

GROWING SORGHUM.

Method of Planting.

Last year I irrigated two and one-half acres about the second week in June, then as soon as dry enough I plowed and harrowed the ground until it was in good condition. I took an ordinary disc wheat drill, regulated so it would sow about forty pounds per acre letting each drill sow. That was all I did to it until time to harvest it, cutting it when the seed was just beginning to harden, putting it up to use as hay the middle of September.

Method of Harvesting.

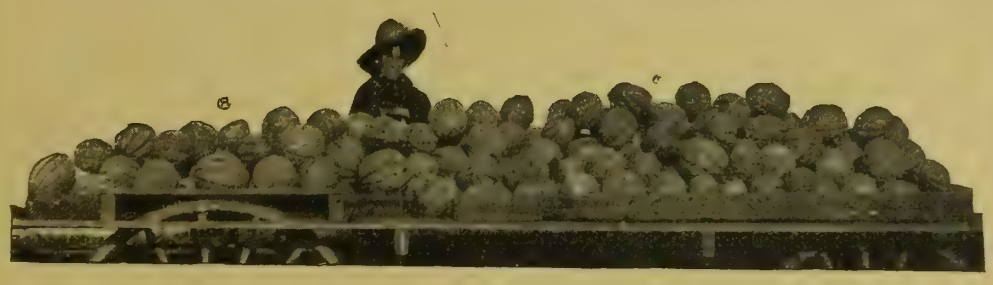
At time of cutting it had grown to be 8 or 10 feet in height. I cut it with an ordinary mowing machine, in a day when there was quite a strong wind, cutting towards the wind, and only cutting one way. So it fell back clear of the sickle.—E. B. Robinson, Hanford, California.

The New Melon

HAS BEEN NAMED THE

J. & M. Christmas Melon

By Charles Richardson, of San Gabriel, Cal., who was awarded the $5.00 offered by Johnson & Musser Seed Co. for the best name for the New Melon. **Price—Per oz., $2; per pkt., 50c.** Sold only by Johnson & Musser Seed Co.



The Most Popular Musk Melon on the Los Angeles Market. For Two Years

Gautier's Pineapple Musk Melon

Has eclipsed all other varieties to such an extent that ninety per cent of all the musk melons grown for the Los Angeles market are of this variety. **Price per lb., $1.00.** Sold only by Johnson & Musser Seed Co.

Oregon Evergreen Sweet Corn

Last year was the first season this excellent sweet corn was grown extensively for the market, with the result that the newspapers commented upon the unusual excellence of the sweet corn offered by the peddlars. No market gardener will now grow any other variety because Oregon Evergreen Sweet Corn will yield nearly double the crop of any other variety, is less liable to the ravages of the worm and, once having tasted this, the consumer will have no other. **Price—Per lb., 15c; per 100 lbs., $8.00.** Sold only by Johnson & Musser Seed Co.

Eastern Grown Field Corn

We have just received our usual carload of seed corn from Nebraska. It is extra selected and hand-picked. Send for samples of the varieties you wish to plant. Why plant common seed when 25c worth of our extra selected hand-picked Eastern corn will plant one acre. **Price—Per lb., 5c; per 100 lbs., $3.50.** When ordering corn seed to be sent by mail, add ten cents per pound for postage.

Anaheim Chili

Nearly ten inches long

In this chili Southern California should feel a personal pride. It is of local origin, and as we are always on the lookout for the best of everything we discovered this excellent pepper, already popular in the Anaheim section, but little known elsewhere. We now buy the peppers and take the seed from them, so we are enabled to positively guarantee our seed true to name and the best of its kind. **Price—Per kpt., 5c; oz., 25c; per lb., $2.50.** Sold only by Johnson & Musser Seed Co.

The Up-To-Date Seed House

EGG MACHINES

From a practical standpoint hens are simply egg machines. They take the feed, convert it, and lay the eggs. But like every other kind of machine, to do the most work, the hen *must* be in perfect order. The digestive apparatus is the important factor in egg production. Many poultrymen feed an abundance of good albuminous food such as should produce a profitable egg yield, but if the digestion is impaired and the egg-organs dormant, no amount of food will produce the desired results. But give the fowls a tonic to increase the digestion, a little iron for the blood, and regulate the system generally, toning up the egg-organs and **you are certain to get eggs even in the coldest weather.**

DR. HESS Poultry PAN-A-CE-A

the prescription of Dr. Hess (M. D., D.V. S.), contains all these principles to increase egg production and cure cholera, roup, indigestion, etc. It has the indorsement of leading poultry associations of the United States and Canada, costs but a penny a day for about 30 fowls and is **sold on a written guarantee.**

1½ lb. package, 35 cents; 5 lbs. 85 cents; 12 lbs. $1.75; 25-lb. pail $3.50.

Send 2 cents for Dr. Hess 48-page Poultry Book, **free.**

DEATH OF LOVE.

Yet each man kills the thing he loves,
By each let this be heard:
Some do it with a bitter look,
Some with a flattering word;
The coward does it with a kiss,
The brave man with a sword!

Some kill their love when they are young,
And some when they are old;
Some strangle with the hands of Lust,
Some with the hands of Gold.

Some love too little, some too long,
Some sell, and others buy;
Some do the deed with many tears.
And some without a sigh;
But each man kills the thing he loves—
Or love would never die.

—Balad of Reading Gaol.

STORY IN FOUR LETTERS.

COLLEGE student sits in his room smoking and writing letters.

First letter, Percy Walker to his uncle, Samuel Walker:

"My Dear Uncle—I write this my fortnightly letter to you to tell you that I am still doing very well in my classes—studying hard, devoting my whole time to my college duties. I haven't missed a lecture so far this term. You know, I am very fond of athletics, but remembering your advice to be careful about letting sports interfere with my studies I have hung up the racket and the golf stick, contenting myself with poring over books. It is very hard now that the spring days are on to see the fellows going out in field costume for practice; but remembering your valued advice, I resist the temptation.

"Then, too, I have taken advantage of your warnings about drinking and smoking. Cold water is good enough for me, and as for smoking, the smell of tobacco makes me sick.

"I hope you and my aunt continue in your usual good health and that your eyesight has improved. Tell Aunt Caroline that I am taking all the spring medicines she sent me. I am really quite fond of the herb tea, and the liver mixture is doing wonders for me. Tell her that I am heeding her advice not to throw off my overcoat too early in the spring and not to go out on damp ground without my rubbers. The muffler she so kindly sent me at Christmas time I have worn constantly all winter.

"Be assured, my dear uncle, of my affection for you and my aunt and believe me your devoted nephew,

"Percy."

Second letter, Percy Walker to his fiancee Miss Ruth Stevens:

"Dearest Ruth—Have just written uncle, and now comes the delight of writing to you. (Stop till I light a pipe.) I have to tell you the glorious news that I am first in winter practice in tennis and have won a place in the university crew. I've had more time for sports this term because I've chosen elective studies that don't interfere—the lectures, I mean—with the hours for practice. I am having a hard time in the spring examinations and for the last week have been 'boning' night and day. I hope to slip through—if my ponies don't go back on me—but regret that the confinement and lack of exercise may 'throw me' in my candidacy for a place in the football team.

"By the bye, I was forgetting to tell you that I gave 'a wine' in my room last week, at which two baskets of champagne were consumed. There were twelve of us, each man drinking two bottles. The gang was too high mucky-muck for pipes, so I had to buy a box of cigars. This took my last dollar, and uncle's next check isn't due for two weeks. I wish I dared ask the old rooster for an extra. He'd send it quick enough, but it would give me away. I'm telling him I have only term and hash bills to pay, and he knows my allowance is plenty for that.

"Mind, sweetheart, when you see uncle to tell him that I've taken a prize. It's for singles in tennis, but he'll think it's for a thesis in Greek. And tell Aunt Caroline that I've been invited to take the superintendency of the Sunday school at the Third Presbyterian church. They'll consider me too modest to write them these things and will think all the more of them coming from you. Goodby, lovey. With a billion kisses, your loving.

"Percy."

Enter a gang of students to discuss the makeup of the baseball team for the coming season. When they leave the letter writer is about to leave, when, seeing his letters, he puts them in envelopes and hurriedly addresses them. Then he runs after the athletes.

Third letter, Miss Ruth Stevens to Percy Walker.

"Dearest Percy—You naughty boy! You have sent me by mistake a letter to your uncle. (Great Scott, I must have sent her letter to uncle!) Oh, how I laughed when I read it! (For heaven's sake, it's no laughing matter!) You ought to be ashamed of yourself. You devoting your whole time to your studies! 'Cold water good enough for you!' 'The smell of tobacco makes you sick!' Then those 'spring medicines' your aunt sent you. You know you never wear an overcoat or rubbers and seldom a hat.

"I think you'd better go back to school and learn to write. It was all I could do to read your letter. You must be more careful. Some day you'll be sending one of your letters to me to your uncle."

Soliloquy: That's just what I have done. Ruin stares me in the face. Uncle will stop the funds, and I'll have to leave college. And that when I've just got where I wanted to get on the teams. Well goodby, alma mater. I go to some sweatshop or other, where I'll have to come down to fingering other people's filthy lucre.

Fourth letter, Samuel Walker to his nephew:

"Dear Percy—Yours of the —th inst. received. Your handwriting is so bad that I can't read it. I suppose it is a request for money, so I inclose a check for $100. Your affectionate Uncle.

"P. S.—Don't go out of your room if you can help it on these damp spring mornings. There is a great deal of pneumonia about."

Soliloquy: By thunder! What an escape!—Howard B. Turner.

Magistrate (severly)—Do you know the nature of an oath, boy?

Boy—Know the nature of an oath, your lordship?—and me your lordship's caddie!

"Ya-as, suh, Ah was a slave befo' de wah, suh.' "But when the war was over you got your freedom?' "No, suh; Ah was married den, an' Ah's been married evah sence.'

CARE OF THE EYES.

"Most people who use glasses consider them a necessary evil; a sort of crutch to assist lame vision. Of course, those who wear them merely because they think them stylish or becoming are not deserving of sympathy; but unfortunately, the majority who wear them have reason to do so. If every one would follow the advice in this article, with few exceptions, they could postpone the use of glasses indefinitely, and many who are now using them could dispense with them within a comparatively short time. If school teachers would drill their pupils daily in Calisthenics for the eyes, as well as the rest of the body, the proportion of school children wearing glasses would be greatly lessened.

"Take care of your general health. Get plenty of sleep, and as regularly as possible. Remember, the eyes draw their nourishment from the same source as the rest of the body, viz., the blood.

"Always close the eyes for a few seconds when changing suddenly to a bright light. Do not face a light to read, write or work by.

"Do not sleep facing a light; not even moonlight.

"When your eyes are very tired, bathe them in hot and cold water alternately; first hot, then cold. Apply the hot and cold water also to the back of the head and neck, at the base of the brain. The hot application relieves congestion; the cold stimulates the blood and nerve vessels to renewed activity.

"Massage the back of the head and neck, along the spine. Notice the course of the optic nerve.

"Cultivate a cheerful happy frame of mind; with kindness and love in the heart. The eyes express the emotions. They are indeed 'the windows of the soul.' From a phrenological standpoint, this is readily understood.

"Hold some small object in your hand (a pin will do;) look at the head of it and change the focusing distance by bringing it to your nose, then extending as far as you can reach; varying from right to left; high to low, and vice versa, describing circles in different directions. While at this exercise, glance onward, lining up with some object at a distance. Vary the distance and direction.

"Standing, reach as high as you can; then bend, trying to touch the floor near your feet. With right hand on the floor, let the eyes look at a finger of the left hand while you bring the finger to your nose then upward as far as possible and if not too much strain back to the nose. After a short rest repeat reversing the position of the hands.

"It is a good plan to sometimes practice the exercise with one eye closed; then the other it naturally permits the stronger to do the work and only gets benefit in proportion.

"Looking in all directions, high, low, right, left, etc., in order that every muscle be kept in normal condition. Maintain position of head and body when reading, writing, sewing, etc. Better rest completely for few minutes than to double up, trying to rest and work at the same time. If you must read lying down, rest the eyes completely every few minutes; but an erect position is the proper one.

"The point to bear in mind is that ever muscle should be used, but not strained. Never try how long you can look at an object that is close to you.

"If you will observe these rules you will be well pleased with the results. An occasional washing with weak salt water is very good for weak eyes, and for many affections of the eyelids. About a level teaspoonful of salt to a pint of water.

"If any foreign substance gets in the eye, have it removed as quickly as possible. Never rub the eye that has irritating substance in it. If you can cry out of that eye, do so, but let it relax, so the object may float away. A flaxseed placed under the lid will give relief.

"Bear in mind, whatever affects the health, especially the nervous system, will eventually affect the eyes.

"Straining the eyes may induce headache, but cause for headache is likely to affect the eyes."—R. W. Travers.

THE HAY BOX.

In the German army for some years the "Hay Box" has been used to advantage, and it is recommended to housewives as a means of saving fuel and securing good results in cooking cereals, chicken, macaroni, or anything requiring long, slow cooking or steaming.

It may be only a close, wooden box with good cover lined with hay, asbestos, cork or other non-conducting material. The principle is to retain the heat which is generated by use of any ordinary coal gas or oil fire. Nests should be made in the hay in which will fit closely the pots containing the articles to be cooked. The food is to be brought to the boiling point in utensils which may be very closely covered and placed in the nests prepared in the hay or other non-conducting material with which the box is lined. The box must be closed immediately in order not to allow the heat to escape. The outside cool air cannot reach the utensils nor the inside hot air escape. The food continues to cook evenly and thoroughly. About twice as much time is required as in cooking over the flame. There is little evaporation. Consequently, care must be taken not to use too much water in preparation.

Many articles of food are better for long, slow cooking and as no fire nor attention is needed it proves an economical means of preparing food for the table.

While a very desirable cooker is on the market, many make their own so-called "hay boxes."

In many of the shows, prizes are offered for dressed poultry and for best dozen white-shelled eggs and best dozen brown shelled eggs. We would like to see this branch of the industry encouraged. The Poultry Associations and Farmers' Institutes should hold a joint show and in this way we would be able to reach more farmers and ranchers and gradually get them interested in standard-bred poultry.—Frank H. Thomas.

Mohair is likely to become an important product in the United States. At present, however, there are probably not more than 1,000,000 pounds of the substance grown here. It comes from the back of the Angora goat, three or four pounds being secured from each animal. The price of mohair varies from 25 cents to $1.25 a pound.

An infuriated man rushed into a newspaper office and demanded to see the editor.

"I am the editor," quietly responded he of the shears and paste-pot.

"Well, I want to know if this is the paper that said I was a liar."

"It is not; possibly it was our contemporary down the street." And then as he idly toyed with a paper-weight the editor added blandly: "This paper never prints stale news."

FARM TELEPHONES
Have had as much to do with making the farmers prosperous as any improved implement of the age. If you are interested in making money and saving time and worry, write us for booklet, "Over the Wire." WHITE CITY GRADER CO., BOX D, WHITE CITY, KAN.

WILL NOT STRIP THE BRANCHES

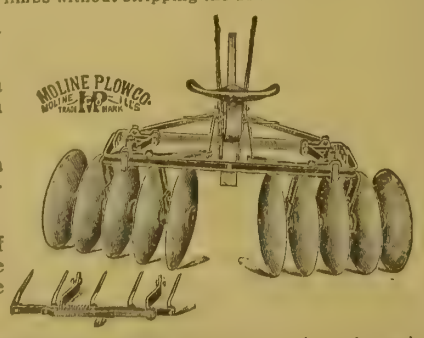
The Moline Reversible Disc Harrow is an ideal tool for orchard cultivation. The frame is built down close to the discs making it lower than any other harrow of its class; the levers are short and always in the center, making it practical to work under low hanging limbs without stripping the branches.

The harrow is all steel and iron excepting the pole.

The discs may be reversed in a moment without taking them from under the frame.

The gangs may be tilted by a simple adjustment of the malleable frame spreader.

Bearings have a double set of wood blocks, giving twice the wearing surface to meet the end thrust.



For Orchard Work the Moline Reversible is equipped with an extra long frame instead of extension head.

The correct design, great durability, ease of handling, low build, arrangement of levers and adjustment for setting the gangs in and out on the frame makes this an all around harrow. Protected by patent. Made in four and five foot, 16, 18 and 20-inch discs; four and five foot, 16 and 18-inch cut out discs.

Before buying a Reversible Harrow ask your dealer to show you the MOLINE.

Send Us Your Name and Address, enclose four cent in stamps to pay postage and mailing, and we will send you our FLYING DUTCHMAN SONG BOOK and Junior Catalogue Combined, containing Twenty-six old Familiar Songs with words and music.

Bees and Their Care

RAISING BEES.

IT MAY be safely said that a place where farming, gardening or fruit raising can be successfully followed is adapted to the profitable keeping of bees—in a limited way at least, if not extensively. Many of these localities will support extensive apiaries. In addition to this there are, within the borders of the United States, thousands of good locations for the apiarist—forest, prairie, swamps and mountain regions—where agriculture has as yet not gained a foothold, either because of remoteness from markets or the uninviting character of soil or climate.

This pursuit may also be followed in or near towns, and to a limited extent in large cities. The ability of the bees to range over areas inaccessible to other farm stock, and to draw their substance from dense forests, when the timber is of the right kind, and the freedom which, because of their nature, must be accorded them, to pasture on whatever natural sources are within their range of three or four miles, must be taken into account in estimating the possibilities of a locality.

It will be found that very few localities exist in our country where at least a few colonies of bees may not be kept.—Rural Magazine.

THE BEE BUSINESS.

Where the business of beekeeping is pursued with assiduity and attention it is just as profitable as any other legitimate business, unless, indeed, the locality chosen happens to be a bad one, which is seldom the case. Care should be used in starting an apiary to get the best bees, in the best hives, fitted out in the best way. It will pay to buy from a man of known probity and honor, and who is an expert withal. Careful attention to this will save ultimate disappointment. It is well to order only standard goods, and should it ever become necessary to sell the apiary, one would be in a position to ask the regular market price for all fixtures. Odd-sized bee appliances are hard to sell. It is also important to secure pure Italian bees to start with! These are the favorites and with good reason.

Generally the manufacturers of hives can tell whether any given locality is a good one for bees, and will generally reply to an inquiry of this kind. As a rule too, they know what hives and appliances are best suited to the inquirer's environment. What to spend on a start depends on the condition of one's purse, and how to spend it is better left to the dealer in bee supplies, if he is a good, reliable man. If one is merely a beginner, it will be well to trust a good deal to his sense of right, but first find out if the seller is a good, honorable man.

When to start is a matter of taste. Usually people start in the spring, expecting to get some returns before fall. But bees are cheaper in midsummer and cheaper still in the fall. There is no objection to anyone purchasing bees locally, provided one knows for a certainty they are really good. Perhaps the orthodox plan is to make out an order for a set of hives, etc., fix these up and then depend on some nearby apiary for the bees. Usually one has to wait till the swarming season for the bees, and it is well so to wait, as a swarm works with great energy. If the seller of the bees will come with them and put them in the hive, the beginner will get a good insight into the proper handling of the bees. In fact no opportunity should be lost of seeing expert beekeepers actually at work handling bees. In this case, practice outruns theory, though it is a fact that many beekeepers have obtained their knowledge of bees from books, supported only by their own observations. It is the case in the United States today that one can rapidly acquire a beekeeping education when so minded, be the student man or woman. Usually when a woman begins to take a lively interest in beekeeping her friends and neighbors regale her with stories about fearfully stinging bees, and certainly these stories are calculated to frighten almost anyone. But modern apicultural science has provided for this contingency, and beekeeping has been robbed of its terrors. With a good veil over the face, a pair of beekeeper's gloves, and a good smoker, some of our modern beekeeping women are not afraid of the worst bees in existence. And here let us note the fact that some of the brightest, ablest and most successful beekeepers of our day are women. In England the Countess of Warwick maintains an excellent beekeeping school for women in which all the work is done for and by women.

Beekeeping certainly appears to be an ideal out-of-doors occupation for the weaker sex, and is ahead of many so-called womanly pursuits.

GOOD QUEEN NEEDED.

A Massachusetts bee man declares that the first requisite to success in wintering bees is to have a good queen. He says that a recent examination of his hives showed that all colonies that had been requeened during the current year contained from five to eight frames partly filled with brood on the first of October. These are the bees that will be full of life and which will hustle for honey in the spring. The bees hatched late in August or September, will probably all die during the winter. Wherever it is practicable bees should be kept in the cellar during the winter, as it is less difficult for them to maintain life than when forced to live outside. If an outbuilding is used the wall should be doubled, with three feet of sawdust placed between them and an equal amount overhead. One of the essential things in the winter storage of bees is darkness, and some contend that absolute quiet is necessary, but this has been proved untrue. If the bee owner has a basement in his barn, that will make an excellent place to store them. If the bottom boards of the hive are removed no other ventilation is necessary, provided the doors are opened for a few hours each week on nice days.

SWEET CLOVER FOR BEES.

We were out west and saw a great deal of sweet clover with bees just swarming on it and getting nectar. It made us feel like moving, and yet we could have sweet clover if we would sow the seed. It will grow in waste places, and we would very much rather see it along the streets, roads and all highways than the weeds that are so unsightly and of no account.

We saw it growing along all side streets. It sent out a sweet-smelling savor and the bees greatly delighted to work on it. Stock, especially cows will eat of it when it is young and tender, and as it keeps on sending out new shoots and blooming until frost, it is a valuable honey plant As it will grow in hard ground and soon kill out noxious weeds, it is valuable for that reason also. There is some in our home town, but we would like to see a great deal more of it. A prominent railroad of the South has had it in considerable quantities along its roadbed, and was requested by beekeepers living along the line not to cut it during blooming time, which the managers very kindly and considerately consented to, thus enabling beekeepers to receive great benefit.

Coulson's Special Dry Chick Food

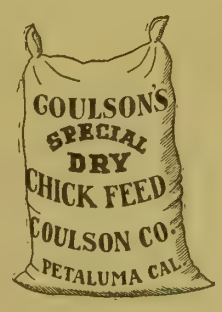
Feed to Your Chicks

And See Them Grow

Advantages of Coulson's Ready Mixed Chick Feed

The proper feeding of poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

Chicks should be given a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are best adapted to give nourishment to the growing chicks: Sweet tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other things.



It is clean, sweet feed that is easily digested, and chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks, at a cost of about 4 cents apiece.

Ask your feed dealer about Coulson's special and be sure that he does not sell you something else.

If your dealer does not keep it, write us, and we will tell you where and how to get it.

To be able to raise the chicks that you hatch and have early broilers to **SELL AT A HIGH PRICE**; to raise **NICE LARGE HEALTHY CHICKS**; to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Coulson Poultry & Stock Food Co., Petaluma, Cal. Milwaukee, Ore.

The Sweet Pea in California

WHEN one visits the miles of sweet pea farms in the Santa Clara valley and notes how rank and riotous the vines, how profuse and perfect the blossoms, the strength and purity of colors, he rapturously exclaims with the immortal Milton. "O flowers, that never will in other climate grow."

So cosmopolitan is this popular flower that its blooming season is eagerly awaited in all the less favored climes as the sweet harbinger of the perfect fullness of spring. The seed is sown in the cool uncertain days following the winter's close, and the first sweet pea to show its modest face is welcomed as an assurance that the days of chilling winds and biting frosts are past and the more tender, delicate plants may safely brave the elements.

In our land of sunshine the sweet pea may be our constant companion if judicious care be exercised to plant at proper periods throughout the year, for we have had them run rampant over fence and trellis while the gardens east of the Rockies were mantled with winter's snow and ice.

The unkindliest season of the year for this flower in California seems to be in mid-summer when, beneath our scorching summer's sun, its petals shrivel and shrink until the blossoms are small, poor in color and texture, and sadly deficient in numbers. Happy the garden owner, at this time, who has a somewhat shady spot reserved for the sweet pea.

At all times of the year it is desirable to have the roots so far beneath the soil that they will not become heated during the hottest day, and for this reason many experienced growers plant the seeds in trenches the bottoms of which are three or more inches below the surface. After the plants are well up the soil is filled in, a little at a time, so that at the end of a week or two the surface is once more smooth. They are high livers if any choice is given them and grow in greatest luxuriance when well supplied with food and drink.

Coulson's Mixed Foods

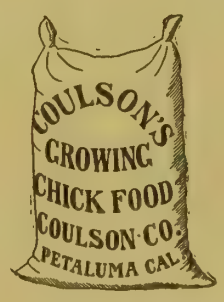
Must Be Used

From The Start

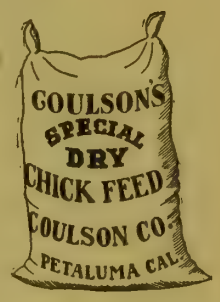
Waiting for meal of Special Dry Chick Food

If you want to get plenty of eggs in winter, you must start your plans by raising lots of chicks in the Spring.

Raise them on



Coulson's Special Dry Chick Food



for the first six weeks or so, till they are well feathered, strong and active. Then keep up their continuous and rapid growth by feeding

Coulson's Growing Chick Food

This will keep you free from the many losses resulting from improper feeding of the chicks, will bring them rapidly to maturity and will insure you a quantity of eggs in the following winter when prices are high.

Superiority of Coulson's Special Dry Chick Food

Gentlemen—

IN KENTUCKY.

Man born in the mountains of Kentucky is of fued days and full of virus. He fisheth, fiddleth, cusseth and fighteth all the days of his miserable life.

He shunneth water as a mad dog and drinketh much mean whiskey.

When he desireth to raise h— he planteth a neighbor, and lo! he reapeth twenty fold. He riseth even from the cradle to seek the scalp of his grandsire's enemy, and bringeth home in his carcase the ammunition of his wife's neighbor's wife's cousin's father-in- law, who avengeth the deed.

Yes, verily his life is uncertain and he knows not the hour when he may be jerked hence.

He goeth forth on a journey halfshot and cometh back on a shutter, shot.

He riseth in the night to let the cat out, and it taketh nine doctors three days to pick the buckshot out of him.

He goeth forth in joy and gladness and cometh back in scraps and fragments.

A cyclone bloweth him into the bosom of his neighbor's wife and his neighbor's wife's husband bloweth him into Abraham's bosom before he hath time to explain.

He emptieth a demijohn into himself and a shotgun into his enemy, and his enemy's son lieth in wait for him on election day, and lo! the coroner plougheth up a forty-acre field to bury the remains of that man.

Woe, woe is Kentucky, for her eyes are red with bad whisky, and her soul is stained with the blood of innocent moonshiners.—Martin (Tex.) Democrat.

The English Walnut in the North

Present Condition of Walnut Culture in Oregon; The Propagation, Varieties Used, Soil and Climate Required, and Other Very Interesting and Valuable Information

By C. J. LEWIS, Horticulturist Oregon Agricultural Experiment Station

SCATTERED all up and down western Oregon we find the English walnut growing, in plantings ranging from isolated trees up to those of one hundred acres. The majority of those trees are in bearing and go to prove that we have conditions here suitable for growing the walnut. While many of the trees over the state never bear, or produce only inferior nuts, there seems to be ready explanation for their failure.

Southern Trees Useless.

The barren trees are either the Southern California type, principally Santa Barbara, or they are trees grown from nuts picked up at stores. The climate here is such that almost invariably the frost catches these trees, at times even injuring the tree itself. In sheltered places the Santa Barbara occasionally bears. The trees bearing inferior nuts are chiefly seedlings which were not chosen with care. We also find in places quite old trees that have made little or no growth, and investigation shows soil conditions to be such that only failure might be expected.

Thus we see that we must choose our trees with care and have soil of the right condition. With this care, orchards up to fourteen years of age are doing nicely. However, we have no old orchards. Our old trees are principally isolated trees and perhaps they are not a fair index of what a whole orchard at their age would do. As regards young trees we find, for instance, that Mr. Thomas Prince has three hundred and fifty trees planted in 1897, and two thousand trees planted in 1898. Last year he harvested between two and three tons of nuts and this year between four and five tons.

Dr. Finck of Dallas has a tree now thirteen years old which two years ago bore seventy pounds of nuts. Mr. C. H. Samson of Grants Pass has two hundred and fifty trees nine years old that began bearing at seven years. Mr. Tiffany of Salem has a tree fourteen years old which last season produced one hundred and fifteen pounds of nuts. Mr. E. Britt of Jacksonville has a tree that has never failed a crop for twenty years. In addition to these there is quite a large acreage of young trees.

In the enighborhood of Mr. Prince's orchard at Dundee we find about three hundred acres. Mr. Ferd Groner of Hillsboro has eighty acres. At Jefferson, Shedd, Jacksonville, Ashland, Merlin, and Grants Pass, are quite large plantations. From the crops taken from isolated trees at twenty years and over we might assume that the orchards at that age will be heavy bearers. However, we have not as yet the proof.

While I myself have such faith in the future of the walnut in Oregon that I would feel willing to set out a walnut orchard, I would not want to give such advice as to lead anyone to stake his all in walnuts. Let us be conservative and plant in moderate quantities, and the near future will demonstrate without a doubt what the walnut will do. The future seems very rosy, but until our young orchards have reached an age of about twenty years and have shown that they are heavy bearers, we have not the right to proclaim that the walnut in Oregon is a decided success.

Propagation and Grafting.

At present among walnut growers there is more or less controversy as to whether we shall plant nuts, seedlings, or grafted trees. Some maintain that only by planting seed in the place where the tree is desired can good results be realized; but broad investigations over the state do not bear this out.

Trees are grafted on their own stock (Juglans regia,) or the California Black (J. Californica,) and on the American Black (J. nigra.) We also have several methods of budding and grafting, but none of the methods has so far brought a large percentage of good grafts. Occasionally we hear of men who claim that they can graft over 90 per cent., but further investigation generally shows that such is not the case. Of the American grafters, Mr. Geo. Payne of California is about the most successful of whom I have heard.

When trees are grafted on their own stock they make rather slow growth and for this reason the method has not met with much favor. When grown on California Black walnut stock they make a rapid growth and seem to come into bearing sooner, and will, it is claimed, grow in heavier soil. On American Black walnut they make rather slow growth.

Mr. Prince of Dundee thinks that a good deal of the failure in grafting has been due to the fact that too soft wood has been used, and that where two-year-old wood has been used better success will be met with, as the one-year-old wood is soft and tends to be pithy. Doubtless he is right.

On the other hand, Mr. Payne of California, I believe, uses the yearling wood, grafting either the two-year-old or the four-year-old tree. The three-year-old tree is too large at the collar to be easily grafted and too small to be top-worked easily. The two-year-old tree can be easily root-grafted and the four-year-old can be easily top-worked.

The Right Kinds.

The question of variety is one every grower must solve. At the present time there is practically only one point on which all growers unite in regard to varieties for Oregon, and that is, they must be the late-blooming kinds, known as the French varieties, such as Mayette, Franquette, etc.

Each nut has its champions, but the two varieties named are the general favorites. Time alone will settle the supremacy of any variety or varieties over others; but it is only reasonable to suppose that the walnut, like the apple, will demonstrate that each variety is adapted to certain conditions, and fills a valuable place either commercially or as a home nut. Already certain characteristics are being associated with each variety—thus, the Proepurturien bears while very young and the nut is of fine quality, being an excellent home nut.

The Chaberte seems adapted to high altitudes and poor soils, and the kernels separate easily. The Franquette is noted for its good size and prolificness; the Mayette, for extra good quality; and so on down the list. These nuts also have their weak points, which will be brought out in the descriptions following. Not only do I expect to see each variety establish itself in some one of our varied conditions, but I also look for more varieties,—for seedlings superior to anything we now have.

Again, we can improve the varieties we already have, by selection. They already show improvement over the foreign nuts in both size and flavor. Our nuts are now being sought for by the fancy grocers, being considered the best nuts on the market. Let us give these varieties a fair show, and time will demonstrate their value.

Franquette.

Originated by M. Franquette in the early half of the last century; a large nut, rather oblong, being pointed at apex and slightly flattened at the base. The valves formed by the joining of the two halves of the shell are very pronounced, bulging out to the extent that the nut can be lifted by the appendage. Passing from apex to base are suture lines, giving the nut a more or less ribbed appearance. The veining on the shell is not very pronounced. Shell, medium to thin, not being as thick as that of either Mayette or Parisienne, but being at the same time well sealed and thick enough to ship well.

The inner partition shell separating cotyledons is thin and separates easily from the kernel. The kernel is plump, filling the shell and fitting rather closely along the valve lines, thus not allowing as easy separation of meat from shell as with either the Mayette or the Parisienne. The pellicle is pale yellow and glossy and is pronouncedly veined. The convolutions are quite large and coarse. The quality is excellent, having a rich, nutty flavor. The Franquette seems to show a tendency to be uniform in size and shape. It is a late bloomer, very hardy and prolific, and thus far has shown a tendency to be free from diseases.

Mayette.

An old, standard French variety that has been in cultivation for a long time. It is the Grenoble nut of commerce, and comprises fully half of the French crop. It is often spoken of as a medium to small nut, but this, I think, is due to the fact that we have, to my knowledge, no isolated grafted orchard here on the coast from which we can select seed, and much of the seed obtained abroad has been inferior. Again, we sometimes find nuts sold as Mayette which are not.

The true Mayette is above medium, to large, in size. In fact, some of the largest nuts I have collected in Oregon are Mayettes. In form it is not so oblong as Franquette, but slightly broader, and flatter at the base and more blunt at the apex. It is not ribbed as pronouncedly, but the veins are more prominent. Very deep pits occur in the region of the valve, which is less pronounced than with Franquette. The shell is somewhat thicker, the kernel large and plump, separating very easily from the shell and from the cotyledon partitions. The pellicle is dull and of a light brown color. The convolutions are not so large as with Franquette, but are more numerous and more sharply pointed, while the veining is less pronounced.

In quality, it is of the very best, being a dessert nut of the highest quality and bringing the highest price in the market. Fuller, in his des-

Deciduous Fruit Culture

By J. W. MILLS

TRAINING THE THOMPSON SEEDLESS.

THOMPSON Seedless is generally tied to stakes, but the ideal way is to train it over a wire trellis. A Sacramento valley grower told us that from thirty vines of Thompson Seedless grown over a wire trellis, he picked 2000 pounds of grapes. His vines were planted ten feet apart. This made fourteen and one-third tons per acre of green fruit. On some adjoining vines, same age, but tied to stakes, he got but four tons per acre. The latter was from an acre plot so that it was not figured out from a few vines. This was a difference of over 10 tons per acre in favor of the trellised vines, a very good profit on the wire used.

On the other hand, a neighbor had a different experience during a cold spring. He had some Thompson Seedless on both trellis and stakes. A late frost killed all the fruit on the trellis, being a total failure that season. On adjoining vines that were tied up to a six-foot stake, he sold $2.40 worth of grapes per vine. This again illustrates the uncertainty of fruit growing. On general principles, the trellis is the best, but it is well to expect some bad luck even with the best methods.

It is not necessary to tie this grape to a stake or trellis till it begins to bear. It will perhaps grow in better shape, but the main stalk need not be trained long till the vines commence to bear. A trunk a foot high will be about right till trellis time comes. It is well then to prune and tie so that a permanent leader will remain on the wire. Long canes are allowed to grow out from these. The wire is stretched about three feet from the ground and the heavy mass of foliage and vines will swing in the strong spring winds and be uninjured. Last June, a severe wind storm passed up the valley and ruined nearly all the vines that were tied to stakes while those on trellis were practically unharmed. When the grower can well afford to put up the trellis at the beginning of the second year, it may be done to advantage, as the young vines may he tied up in position without the extra expense of using extra stakes.

GRAFTING OVER OLD VNIES.

There come to us sometimes, inquiries about grafting old grape vines, some thinking that they may be grafted above ground to advantage. This is not the case. The only practical way to graft old vines is to cut them off about an inch below the surface of the ground and split the stump, put a wedge-shaped scion in on each side of the split, making the inside barks match, cover with dirt without wrapping and stake so that the scion will not be knocked out. The scion should have two buds, no more or less. The dirt should be mounded up over the scions, leaving the top bud at the surface of the ground. Grape grafting as described must be done about the middle of March. At this time the sap starts in the vines and the uniting process commences between the scion and the stock. Large quantities of sap will flow out into the soil and when this mixes with the dirt it will seal up the wound and aid in the healing process. This will sometimes soak to the surface and when it dries it will form a hard coat at that point. If the scion happens to be growing beneath the surface, it will push around under the crust and will die if not attended to. If rains come at the proper time, the crust will be softened and no bad results will follow. Should dry weather prevail, this surface should be stirred with a rake, great care being taken not to disturb the scion. After the grafts start, it will be found necessary to remove the soil from around them and rub off the suckers that always start. The soil should be packed around the stump again and when suckers appear again, the operation should be repeated. It pays to stake grafts before they get tall enough for the wind to catch them. The loss will be heavy if this is not done. In connection with this, the tops should be pinched off when they get to be a foot high. This strengthens the vines. Packing the soil high around the new top aids in bracing it, but nothing will take the place of the stakes.

Old vines may be budded during the time they are making their spring growth. The vines should be pruned to short stubs and when the new shoots develop enough fiber not to snap when they are bent enough to cause the bark to buckle, they are ready for budding. Take buds from new and succulent growth of the variety wanted, cut them from the part that has well-developed leaves, cut off the most of the leaf, leaving a piece on the stem about as large as a dime. Slit the new cane on the old vine for about an inch and a half, bend it so that the bark will buckle out and separate from the body of the stem. Insert the bud with the leaf stem on and let the branch straighten out again, wrap snugly with waxed cloth and leave it on till the bud knits. This will be in a couple of weeks. If the leaf stem turns yellow and separates with a clean surface from the bud, the job will be a success. If the stem gets black and sticks, the bud is dead. These buds should be left dormant during the summer, prune to them the next spring.

WE STILL BLEED.

A subscriber asks: "Who was the originator of the red, white and blue sign which is adopted by all barber shops in this country? Who started it, and when and where and why was it started?"

Hundreds of years ago the barbers were also the physicians and surgeons of the neighborhoods in which they lived, and combined blood-letting, then a common practice, with shaving and hair-trimming. Brewer says that the gilt knob at the end of the pole represents the brass basin which was formerly used by barbers in lathering their customers. The pole indicates the staff which men who were being bled (firmly held grasped in their hands to promote a free flow of blood, and two spiral ribbons, one of red and the other blue, represent the bandages which were placed round the arm after the operation. Why the barbers adopted red and blue has not been accurately ascertained, but the supposition is that these two colors were employed to impress the imagination of their customers, there being a wide-spread belief in the magical virtue of certain colors. The pole is now used as an outside sign, but the blood-letting continues inside, thus showing the power of tradition or a bad razor.

EUCALYPT PLANTING.

In answer to a letter of inquiry from A. K. Aaberg of Modesto, E. O. Faulkner, Manager of the Tie and Timber Department of the Santa Fe Railroad, writes from Topeka, Kansas, as follows:

I am in receipt of your letter of Jan. 24th, with reference to the planting of Eucalyptus trees, and beg to say that this is our first year of planting, consequently so far we are proceeding on the experience and results of others.

The Eucalyptus may be divided into two or three classes, the Ironbarks, which are very long lived, but of slow growth and few raised so far in California, a second class which grow quicker although they do not give quite such long service, yet the difference is scarcely comparable with their growth, and a third class which do not give good service in connection with ground use, but all have their distinct place in other respects.

We have for nearly two years been investigating the matter, and in many places in California have found trees of the second class thriving excellently so far as growth is concerned, and wherever used the reports of service have been favorable. Of these I have personally seen Rostratas seventeen years old with a butt diameter of 27 inches, height over 100 feet, and others fifteen years old, two feet in diameter, and again twelve years old, 16 inches diameter. I have also seen numerous sugar gums (Corynocalyx) all sufficiently large for railway purpases fifteen years planting, in addition to the Forest Red Gum (Tereticornis), etc. It would take too long to go over every individual case, but while these are slower in growth than the Blue Gum, yet the difference does not seem to be very great, and they have a value for many purposes which the Blue Gum has not.

As to the soil, some of the varieties are reported to do better in a sandy loam, while others like a stronger soil, but I do not think there would be any great difficulty in the varieties mentioned growing on any good soil, provided there was no hard pan near the surface.

As to the rate of growth. In May last I was at the El Toro Plantation, owned by Mr. Dwight Whiting of Los Angeles, and there found many trees two years old twenty feet in height, three inches diameter, and all looking well. I have also seen Sugar Gums six years old 12 inches in diameter, but this is probably an exception.

As to the varieties, we are relying largely on:

E. Corynocalyx (Sugar Gum), E. Rostrata (Red Gum), E. Tereticornis (Forest Red Gum), with some E. Citriodora (Lemon Scented Gum) and E. Resinifera (Red Mahogany).

These are about all the kinds that could be had in time this season, but we intend trying several others another year, and if they do well we will include them later on. There is very little good Eucalyptus timber in the market so that it is hard to ascertain the market price, but I have heard that well seasoned Eucalyptus lumber is worth $100 per thousand in San Jose, and I have also heard quotations of $10 each for forty-foot poles 7 inches diameter at the top, of some of the varieties mentioned. There is no question but that this timber will come more into use as the supply of hard wood decreases, because the Government reports show that the Sugar Gum, for instance, is more than twice as hard as Oregon Fir or Long Leaf timber, harder than White Oak, and almost as hard as the best grades of American Hickory. These tests were taken from trees only fifteen years old by the Government Testing Plant at Berkeley, California, and with such a record there does not seem to be any question as to a future market, once there is a regular and constant supply.

Our grove is located near Del Mar about midway between Oceanside and San Diego, three miles back from the coast, being sheltered from the strong sea winds but near enough so we can get the benefit of the moisture in the air. We are planting in rows eight feet apart and five feet apart in each row. They will be watered from tanks twice each season for the first two years and thoroughly cultivated so as to retain the moisture, but not irrigated. We expect to cultivate once the third year, after which time we believe they will be able to take care of themselves after the fourth year when the trees will have shaped themselves the intention is to cut out every other tree, leaving half the number or about five hundred on each acre to mature, and out of the trees removed we will get from each one fence post if not more. There is no hard pan that we know of on our ranch, and the washes show soil to a depth of eighteen feet. The land is rolling in parts and elsewhere level, some soil being a sandy loam and again a black gumbo. It is reasonable to expect that in one body of 8650 acres in Southern California, all of which we intend planting, there will be varied conditions of soil and contour.

KEROSENE EMULSION.

In one formula freshly-slaked lime is used; and in the other flour. It is found that a perfect emulsion can be made by slaking one-half pound of good quicklime and emulsifying with one quart of kerosene to two gallons of twaer from three to fice minutes. it does not appear to be a matter of much moment whether the lime be dry or powdery when mixed with the kerosene or not, as kerosene emulsions have been made from both air-slaked and freshly-slaked lime, the lime being made into a thin cream with water before adding the kerosene.

When flour was used, it was found that eight ounces was sufficient to hold in suspension one quart of kerosene and even two ounces would make a temporary emulsion for immediate use. If the flour was scalded before adding the kerosene, two ounces of flour was sufficient to make an emulsion that would stay up for more than a week. The flour emulsion is considered the more useful where it is not desired to discolor the tree on which it is used.

The present popular standard for making kerosene emulsion is as follows:

Whale oil soap, one-half pound; kerosene, 2 gallons; dilute to 20 gallons with soft water. Cut the soap into small pieces and dissolve in two gallons of warm water in about a 5-gallon receptacle. While away from the fire, add two gallons of kerosene and boil hard for an hour to thoroughly break up the oil of the kerosene. Instead of boiling, the emulsion may be put into the spray pump and churned violently for ten to fifteen minutes. To do this, turn the nozzle into the barrel. Dilute when ready to use and mix again thoroughly.

On hardy trees, 10 per cent. kerosene is often used, but on young growth, especially of peach trees, it must be used with care. This is made by adding one gallon of kerosene to three of water and churning violently, as suggested above for about 15 to 20 minutes, or until the oil ceases to rise to the top. When this is done, dilute to 10 gallons. Kerosene and kerosene emulsion kill the insect by contact with its body, and are essential only for sucking insects. For this reason, also, the work must be done very thoroughly.

With the Citrus Growers

By J. W. MILLS

DIE-BACK.

THE term "die-back" may cover the condition, which it describes, and may be brought on by several separate troubles, or perhaps any one of them. It is simply the dying back on the ends of the branches of citrus trees. There is a disease known in Florida as the "Florida die-back," and is very destructive to the trees. It does not kill them outright, in fact it may not kill a tree in a lifetime, but will render the tree valueless. It is a very deceptive disease.

Evidence of the Disease.

The tree will present an unusually vigorous dark green appearance in the spring and send out a luxuriant growth and the owner will congratulate himself that the trouble has disappeared. As the season advances, the leaves turn yellow and drop off and the new growth will die and curl for a considerable distance down on the new growth, usually within a few inches of the previous season's growth but it may not take place all at once

It will die back a few inches when the twigs will make another attempt to grow, will throw out new growth of a sickly appearance, die back a little more, make another feeble attempt to grow and at last die almost to the point where the start was made at the beginning of the season. During this time, continual attempts at growth have occurred on the buds near the terminal growth, resulting in a rosette of buds. This is more defined in the case of lemons than with oranges.

After the disease has been present on a tree for a few years and no pruning has been done, there will be clusters of dead twigs all over the outside of the trees, sometimes surrounded with dark green leaves from the growth of sprouts. The lower part of the trunks of the trees will be covered with water sprouts that afford an outlet for the extra flow of sap that has been cut off by the death of the terminal branches. The root system seems to be in excellent condition and the supply of sap is therefore not interfered with.

Another characteristic feature of the disease is the dropping of most of the fruit with a brown discoloration of part of the surface of that which stays on the trees. This discolored part of the skin of the fruit is hard and as the fruit ripens, cracks on the surface. At an earlier stage, a good many of the oranges crack entirely open. The same brown colored growth appears on the young growth in the form of granules.

Its Presence in California.

This disease has made its appearance in various parts of Southern California. One very pronounced case is near Pomona, and several nearby orchards are slightly affected in small areas. The most widespread and aggravated condition of this disease that we have ever seen, is in the San Bernardino valley. In every case which has come under our observation, the location of the groves has been the same in relation to the mountains near the southern base.

It occurred to some growers that the trouble was due to a lack of fertility in the soil. Analyses of the soil showed that such was not the case, but practical tests were made with stable manure, complete commercial fertilizers and with nitrate of soda straight. None of these had any effect in one particular case. Trees almost adjoining never were affected and always bore good crops. On the affected area, tiling was practiced with the idea of areating the soil, but with no effect.

It was our pleasure to see one grove in the vicinity of Highlands, which was, until last year, so badly affected with the "die-back" that the owner intended to cut it down this season, but a neighbor who asked to have a trial at it was given permission, and with special treatment and fertilization, the grove held its fruit and new growth, and is now in a thrifty growing condition.

This grove has the dead wood that is so characteristic of the disease still on the trees, and this with the new growth of the past season and the crop of fine fruit, is evidence that the disease can be cured. Another case was pointed out where the trees were at one time in an apparently hopeless condition, but are now as good as any trees in the section.

The method pursued was a good application of fertilizer in conjunction with a spraying of Bordeaux mixture, five pounds of bluestone, five pounds of lime to about seven gallons of water, applied just as the fruit is setting and again about a month later. This seemed to give the disease a check, which, when followed up the next season, completely eradicated it.

If this is a reliable remedy, it is worth a good many thousand dollars to the state. The man who does the work has such faith in it that he agrees to take his pay from a percentage of the increase in the crop.

Fatal Bowel Trouble.

We have a thorough-bred Hereford bull which has a diarrhoea or running off from the bowels in a very liquid conditon. The animal has become poor. I notice a whitish crust soon forms over the discharges, out in the sun. We turned the animal in the barn to eat barley hay for three hours each day since we found him with such liquid discharges, which was three weeks ago. We had one of our registered Herefords die that was troubled in the same way last spring. It died six weeks ago. They cost us $200 per head by buying eight head; please tell me what causes the trouble and what shall I do to cure the animal?

The bulls had been stall-fed before we bought them; since we have owned them (three years or more) they range with the stock cattle. A. E. M., Valley Center.

Usually these conditions arise from either irritating food or impure water. sometimes the cause is tubercular, in this case, as the bulls were high-priced ones., they were probably tuberculine tested before you purchased them. I would make a mixture of one pound of bran, one pound of middlings to one-eighth of a pound of oil cake and feed it to the bull, mixing with it three times a day, one ounce of powdered chalk, one ounce of bisulphate of soda I would give him all the good hay he will eat clean after feeding him the bran mixture, and then take it away and not let him have it until next feeding time. Limit his water to a bucketful three times a day. After twenty-four hours, if he is better, I would increase the bran to double the quantity leaving the same quantity of middlings and oil cake and still feed him three times a day until he recovers his lost condition. If this chalk mixture fails to correct the condition add to the bran twice a day, powdered opium, powdered gentian, powdered fenugrek; each one ounce, containing the chalk and soda with it. The opium powder is only to be given twice a day, give three doses, omit one, repeat until relieved.—M. E. S.

TREES

True to Name

ROEDING TRUE TREES FRESNO, CAL.

Cool weather and bountiful rains have done much to prolong this season. Planters should get their orders in immediately if they desire to secure a complete assortment.

We are still in a position to furnish leading varieties of

Apricots, Peaches, Nectarines
Apples, Pears,
Cherries, Almonds,
Grape Vines
Roses

and are prepared to offer special inducements on quantities.

Citrus

Trees. Our assortment of leading varieties is still complete. All are grown in the great thermal belt at Exeter, Tulare County, Cal.

Olives

Our assortment of oil and pickling varieties was never better. Our catalogue tells all about them.

Roses

It will be worth your while to write us for our list of varieties we still have in stock. We still have many of the leading and best sorts.

Four New and Valuable
Burbank Creations

Our illustrated booklet tells all about them.

Santa Rosa Plum
Rutland Plumcot
Paradox and Royal Walnuts

We are the sole propagators and disseminators of the Burbank creations and we will gladly give any information regarding these great specials.

Our New Catalogue

Our new catalogue is remarkable for its completeness. It contains much valuable information, and is superbly illustrated. Mailed free to any address. Price list on application.

California Horticulturally

By JOHN ISAAC, Sacramento, California

AN INTERESTING REPORT.

THE second biennial report of the Commissioner of Horticulture is now in the hands of the binders and will be ready for public distribution in a few days. It is a very exhaustive report, of 557 pages and contains several papers which will be of great value to our fruit growers and Horticultural Commissioners. There is an outline of the science of entomology, in which, in as compact a manner as possible, is given such instruction and information in this branch as may be of service to those who desire to learn something of it, but cannot devote the time or study required to master the whole subject. A very valuable paper on the Coccidae of California will be appreciated by the Horticultural Commissioners, and is a publication which has long been needed. There are papers on the Codling Moth parasite, the Gypsy and Brown-Tailed moths, a review of insects of the year, reports of all the County Horticultural Commissioners, and the full and interesting report of the last Fruit Growers' Convention, held at Hanford. Altogether it is the best report ever issued by the Board of Horticulture or its successors, the Horticultural Commission. A feature of it is the many illustrations, and especially several beautiful colored plates, which illustrate the text.

PRUNE GROWERS ORGANIZING.

In accordance with a resolution adopted by the last Fruit Growers' Convention, a committee of five, consisting of J. Luther Bowers, Mark L. McDonald, Thomas Jacobs, H. A. Beekhuis and F. M. Crandall, was appointed by Hon. Ellwood Cooper for the purpose of taking steps looking to the organization of the prune growers of the state and the profitable marketing of the prune crop. This committee has held its first meeting, at which it was determined to hold a mass meeting of the prune growers at an early date in Santa Rosa, and consider there the best method of carrying out the expressed object of the resolution. It is probable that out of this effort some method will be hit upon of keeping this great branch of our horticulture from ever again getting into the "Slough of Despond," in which it has wallowed so long.

TUSSOCK MOTH.

The Tussock moth appeared in destructive numbers in the Pajaro valley apple orchards last season, and growers there became alarmed, believing that it would continue to increase and become a most serious pest. The history of this pest in California shows that it occasionally appears in numbers in small localities where conditions have been favorable to it, only to disappear again, and it is often many years between visitations. It is now reported from the Pajaro section that a number of parasites and natural enemies have already attacked the caterpillars and eggs of the pest and that there is a strong probability that it will be kept in check by them this season.

Don't be too quick; pneumonia
Is looking after youse
Who doff your union suits too soon
And don your peek-a-boos.

MASSACHUSETTS AFTER PARASITES

Boston, or at least that portion of it known as Brookline, which is a suburb, seems to be in earnest about getting rid of the Gypsy and Brown-tailed moths. Mr. A. D. Chandler of that town has been sent on a mission to California for the purpose of investigating our method of fighting injurious insects with their natural enemies. He has made a thorough investigation of the work, and expresses himself as much astonished and gratified at our success along these lines and at what he has learned, and will return to Massachusetts a confirmed advocate of the parasite method of controlling pests. Incidentally he came prepared to make a contract for the state of California to co-operate with Massachusetts in the extermination of this plague, and in an interview with Governor Gillett, he was informed by the Governor that while California could not enter into any agreement with other states to do work in their territory, still all that was possible should be done to assist in the work, as he considered it policy to take precautionary measures against the introduction of this great plague into California.

Bad Milk.

I have a Jersey cow, 5 years old, comes fresh in April next. For the past month we have not been able to use the milk or butter because of a strong rancid taste and odor. She went the same way last year, but we did not notice it until about six weeks before she calved.

She has no pasture, but I feed her sweet cow hay, bran, shorts, rolled barley, cracked corn, and middling, but hardly any green feed. The man I bought her from two years ago says he knows nothing about the matter so I decided to ask you as I am always an interested student of your work in the "Cultivator." I am told this is a common trouble with cows, but being a city man my experience is limited to this one.— H. W., Petaluma.

While this may be the fault of the cow, the cases where the cow is to blame are too rare to assume she is at fault without positive trial. If you will take a preserve jar and wash it clean, cover the top with a piece of cotton batting and put it into the oven, giving it a baking, it will be sterile, then wash the cow's udder, rub her clean, take a sheet, pin it over her; now milk four streams of milk on the ground from each teat.

Then carefully uncover the jar, milk one stream from each teat into it, and cover at once with the sterilized cotton, stand the jar where the milk is usually kept—in twenty-four hours open it taste and smell it.

If the cow clears herself, then wash the milk pails, pans and pitcher with hot sal soda water. Rinse with scalding water, turn them up to drain dry. This will end the trouble, if it is thoroughly done. At the University a professor that is as careful as anyone could possibly be about his cow and the milk, had more than his family needed and supplied a neighbor. The little lad that carried the milk to the neighbor was not on hand one night, so the professor took it himself. Rapped at the kitchen door, out came the maid, said, "Yes sir," and taking the can from his hand fished out the milk pitcher from the dish pan, taking up the dish cloth gave it a swish out with the dishwater and then dumped into the pitcher that carefully drawn milk. I asked the professor if it kept; he said, "I did not like to ask."—M. E. S.

THE OLD PAN WAY

50% MORE CREAM

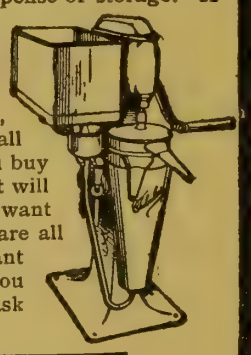
DON'T PAY

The old pan way of raising cream don't pay—it's too mussy and fussy—too much work for the women. And it don't pay in dollars and cents because you actually lose 50 per cent of the cream you ought to get. You can increase your cream product about 50 per cent over pan setting; 33 per cent over cans set in cold water; 25 per cent over patent creamers or dilution cans by using the

SHARPLES TUBULAR SEPARATOR

THE TUBULAR WAY

Besides you can skim the milk immediately after milking—save the handling and the expense of storage. A good milk-house costs more than a **Tubular** and isn't half so profitable—even if you already have the milk-house it will pay in labor saved, in crocks and pans saved, and the increase in cream will be all clear profit. Of course, when you buy a separator, you want the one that will get you the most profit—you'll want the **Tubular**—the **reasons why** are all given in a book which you will want and which we want to send to you **free** if you will only write for it, ask for book H. 260



Mr. Mac Tuttle, Danville, Ill., says "The first week we used the Tubular we made a gain of 12 lbs. of butter from five cows."

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

CALIFORNIA RANCHING.

IT IS poor economy to work a horse down to a barrel stave condition.

It will be months before he recovers his normal degree of strength. As Pat often says, when we meet a thin horse on the road: "Sure, if he had money in his pocket it would not be beer, but barley, he would buy." There is hardly a more pitiful sight than a weary, weak horse pulling a load. I know a church that I would rather not pass on Sunday, the horses tied there are too thin, they patiently wait while their masters worship God. The God of mercy.

Rest Needed.

We all know when a man works until he is thin, he is in a serious condition. He always fails to do effective work; he is ready to take any disease that comes along, and he may never fully recover from the after-effects.

It is the same with a horse; once overworked and he will never again be as resistent to strain and often dies early. A little care—25 cents worth less of work, by shortening up the hours of the day's labor, will add 50 cents to his working value later on. Avoid forcing a horse to greater strain by giving him condition powders to force nature along; give him rest instead by shortening his hours of work.

When a team is weak it will crawl across the fields. I have timed some that did not plow an acre a day. Yet, the driver's time and board had to be paid just the same. That work was costing too much. When this occurs, take off one plowman and put the team into the barn to rest. Let one man work the two teams, day and day about, so that one is resting while the other works. Two acres a day will be plowed and one man's wages will be saved.

Fast and Slow Teams.

Where several spans of horses are plowing in a vineyard or orchard, one slow team will reduce the work of them all. Tom will not start his team across the field until Dick's slow team has come up, turned, rested and started back again. All the men hold back for the slow team.

The older horses on the ranch are often slower than the colts, yet, as they have hardened muscles, will last to the end of the season while the colts will have to be turned out to rest. Yet, if all are worked in one vineyard it is at a loss. I put the older, slower teams on one vineyard and the quick horses on the orchard, out of sight of each other. When a team grows slower it is sent into its own class.

The slowest horses are put into the single plows, for that is where careful work is needed. The fast horse tears the vines, breaks the stakes and often does considerable harm to the vineyard. A slow horse is a gentle one; he is apt to stop when it pulls harder than usual. This prevents injury to the larger roots of the vines.

On a ranch there is a place for all kinds of horses to be put to doing effective work. If this is left to the men it is helter-skelter business and the expense will mount up rapidly. I sometimes think a ranch could be run on the money expended useлessly for lost time, if someone was always at hand to check and make everything tell to greatest possible advantage.

Ranch Laborers Scarce.

Now, that San Francisco is building again, men are scarce. For the first time we have had trouble in securing good men. The men now on the ranch could not be held in council as to the best ways of working, for they are not anxious to work in any way at all. My faithful cook held this conversation with one of them last week. It was the engineer at the pumping house. He was a new man; he had been flushing the house sewer; under the pressure one of the tiles had broken. She said to him, "It is too bad that you have the trouble of mending that pipe." He replied, "What do I care if it breaks every day, if I have to work I would just as leave mend it as anything else." He hired as an engineer, but could not blow off a boiler, so his time was blown off the ranch book promptly. Dear old dad, I miss him in the engine room, he has spoiled us for ordinary labor."

These things may seem too trifling to write about, yet they are all losses and it is only by constant putting into shape the work as it runs along, that it is held up to high effectiveness.

The Household.

Farming is like housekeeping, it consists in a variety of little things, each well done and on time. The season of sowing and reaping come in their appointed time and will not wait our convenience.

The slack housekeeper does try to think that she has caught up with her work when she makes a semi-annual house-cleaning. She does not consider the overwhelming discomfort of the upheaval in which important articles are mislaid and often not found until the next upheaval strikes the unhappy household. This is not conducive to happiness, yet the house is called a home. "A home," no peace, no quiet, plenty of dirt.

A little reflection would show the folly, for a small monthly cleaning of each room in turn and no wild turning out of the husband from his comforts will keep husband and wife good comrades all the while. I wonder how many men and cats are scared away from home by the housekeeper, but I am drifting too far from the ranch.

Keep the Ranch Clean.

Yet ranch working is nearly the same as housekeeping. Clean a ranch twice a year and how the weeds would thrive and the expense creep up. The horses will grow thin for the want of the good hay that did not grow as the land was seeded too late. The cows drop in their milk for want of the corn that was not planted to fill the silo.

All is outgo, no income between the crops to help to grow new crops. See how utterly tired and discouraged the owner has become! Nothing pays! He laments his inability to sell out at a fancy price! Who will buy a run-down ranch! Really, today, half the trouble is in always being late.

In the good old Saxon days a common nickname was Unready, Edward the Unready. All the unreadys did not die off then.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

In California the successful ranchers are the ready ones, if at the beginning of the planting season a definite plan was made. This many acres of wheat requiries so many days plowing; this will take a definite number of teams so many days; so many acres of orchard and vineyard to plow will require so many days.

Set down the number of work days and proportion off the horses for the work. Then before the time comes put every plow and harness in order and see that each horse has a well-fitting collar.

After the work starts, look over the schedule weekly anywhere the work falls behind. Catch it up the next week. Hire a team if necessary. Never allow the work to be two weeks behind. Rather abandon a piece completely; rather than attempt it do it half. The growing season is short and if it is lost, the money expended in planting is gone.

Have some system of checking up weekly. When made a definite business, ranching pays well in California. The owner must be master of the work and not a slave to it. He can be a master if he will study it rather than rush headlong to accomplish without any method in his business.

HORSE DOOMED AGAIN.

Edison claims he has solved the electric motor problem at last—solved it some time ago, in fact; but the material he found suitable for cheap and effective storage batteries—cobalt—was too scarce to be used commercially for the purpose. But by diligent search ample deposits have been found, and now a motor will be made so cheap that no other agency for moving vehicles of any kind will be used.

The horse is to become extinct, or nearly so. "In fifteen years," he says, "we will be paying 50 cents to see one in a side-show." If this last proposition proves true there will be one compensation, the draft stallion faker will be extinct. But don't begin to sacrifice the horse for a few months yet.

Oversour cream gives a sour and, of course, an abnormal taste to the butter.

A really good dairy cow will certainly not gain in flesh when in full flow of milk.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

HANDLING VICIOUS HORSES.

A balky horse can be cured when under the saddle by a very simple method. Turn him around and around in his tracks a few times and then suddenly straighten his head and he will willingly and even gladly go forward. This was the method of the celebrated John S. Rarey, and has never been known to fail.

The jibbler differs from the balker inasmuch as his so-called vice is caused by congestion of the brain. The horse thus affected is liable to bolt or run away after one of these attacks, and is a dangerous animal. Rearing, although commonly termed a vice, is often caused by too severe a curb. Sometimes the rearing horse losses his balance and falls backward. It is needless to say that the rider is lucky if he or she escapes without serious if not fatal injury. When a horse rears loosen the reins and speak to him in a soothing tone, but if he persist give him a harp blow between the ears with the butt of the whip. This will bring him down on all fours with amazing quickness.

Kicking is certainly a vice. Sometimes, however, it is caused by fear, in which case much can be accomplished by gentle management. Exactly the opposite treatment of the rearing animal should be applied to the kicker. Hold his head up with might and main, for the horse can not throw out both legs at once when his head is elevated. Kicking straps are what the name implies. A strap fastened to the shafts over the horse's croup prevents kicking, but this is only serviceable when driven in single harness. Shying is a dangerous fault. It can not properly be termed a vice. It is generally the result of defective vision. Gentle treatment, soothing words and patient persistence in accustoming the animal to the dreaded object will often effect a cure. To lash a horse because he shies or is frightened only aggravates the evil. He will associate the punishment with the frightful object and will fear it more and more each time he encounters it—Country Life.

THE RUSSIAN THISTLE.

The Russian Thistle is a great soil robber. From the time the thorns are out, until ripe, the thistle takes up a large amount of sodium from the soil, and only small amounts of other materials. The thistle makes its heaviest draft upon the soil before the thorns are well out; after that it takes but little of the essential plant food. To prevent the heavy draft of the thistle upon the soil, it should be destroyed while young.

In the last stage of growth, the large amount of sodium taken from the soil is a benefit to strong alkali lands, but before this beneficial loss of sodium takes place, there is a serious loss of nitrogen, potash, and lime. An ordinary thistle of two pounds weight, covering a square yard, will take more potash and lime than two good crops of wheat from the same area. It will therefore be seen that in addition to its proving a serious menace to all branches of agriculture, by reason of its disagreeable character, it is one of the worst soil robbers we have and we should rejoice that we have a state law to compel farmers to exterminate it.

Milk clean—but do not "tug"—to keep up the milk flow.

U. S. CREAM SEPARATOR

The Man or Woman Who Gets a U. S. Will Be Pleased

Paso Robles, Cal., Jan. 23, 1907.
I wish to state to you that after running one of your No. 6 Cream Separators for several months that I can recommend it to anyone as a thoroughly up-to-date machine in every particular.
From 10 cows I realized in 2 months $31.00 increase in profits over my old method.
I have not used any of the repairs yet that came with the machine.
I find it very easy to clean, and operate as I sit down to turn the crank while skimming.
The man or woman who gets a U. S. will be pleased.
Harry D. Draper.

U. S.
Won Blue Ribbon, California Mid-State Fair. Only One Awarded.

The Cleanest Skimming Separator.
The chief reason you want a separator is to get more cream—more money— out of your milk. The U. S. gets the most.

Holds World's Record
For Cleanest Skimming

The Simplest Separator.
Both in operating mechanism and bowl construction. Three gears and the bowl are all the "machinery" there is to the U. S.

A "Simple Bowl" Separator.
Only two strong, simple, easily-handled, easy-to-clean parts inside. Gets ALL the cream.

The Most Durable Separator.
Few parts and those strong and finely built of the best materials by skilled workmen.

The Easy Running Separator.
Gearing correctly proportioned, strong but not heavy, accurately fitted, has ball bearings, and runs in oil.

The Safest Separator.
Gearing all enclosed within the solid, low, one-piece, iron frame.

Our handsome free catalogue not only tells, but SHOWS, everything about the construction and operation of the U. S. 27 pictures. Please ask for No. 20.

When Writing Advertisers Please Mention Cultivator

CARE OF MILK VESSELS.

In the first place I avoid buckets or cans which are put together with creases or solderings, with holes or cracks, which are difficult to clean. A simple one-piece pail is quite easy to clean and the most sanitary. The same is true of cans and other vessels. I avoid using cans after the tin has been broken off or sharp dents appear in the sides. It is almost impossible to clean them thoroughly at such places.

Proper washing consists in rinsing off with lukewarm water the milk sticking to the vessels, then washing with brush or rag and soapy water, finally thoroughly scalding with boiling water or steam and drying quickly. The first rinsing is very important, since if too cold or scalding water is used milk cannot be thoroughly removed from the vessels without considerable difficulty. Then a good brush is absolutely necessary to clean vessels, as a rag will seldom reach all parts of the surface. I have come to believe that steam is a necessity in the dairy, although in many cases boiling water will suffice if rightly used.

Where the vessels are steamed it should be done thoroughly and they must be wiped with a dry cloth and put upon a rack to dry while still warm. When scalded with boiling water be sure that no part of the surface is omitted, and the operation is performed inside and out.—Farm and Home.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

When writing advertisers mention Cultivator

A SHORT LIFE.

Here is the human biography in a nutshell: Born, welcomed, caressed, cried, fed, grew, amused, reared, examined, graduated, in love, engaged, married, quarreled, reconciled, suffered, deserted, sick, dead, mourned, buried and forgotten.

"I suppose you can remember when a lot of this land could have been bought for a song?"
"Yes," answered Farmer Corntossel. "But after seein' how much my daughter's singin' lessons cost that doesn't seem so cheap."

GOOD ENOUGH FOR THE COW.

Farmers as a class look upon the cow as a necessary evil. Dairymen as a rule look upon her as a money-making machine. Both expect her to turn out good products from any old thing that is "good enough for the cows." What they leave the hogs can have, and glad of the chance. How many, many persons are mistaken in this! Can you mention anything that brings in as good results as regards producing capacity of old Brindle?

It is wrong to feed a cow anything which you know is not pure and clean. She should have the best of feed, and also the best of water. Let it be cool in summer and warm in winter. A person never loses by giving good feed, care and attention to a cow. She enjoys a rubbing down with the brush as much as a horse does, and by so doing she becomes more gentle.

A cow knows her master. She shows what she thinks of him by his manner of approaching her. She may come to you with a gentle moo, expecting that little caress which she is so sure she will receive, or she may shy away to show her dislike.

Once a cow takes a dislike to either a boss or a milker, she will never recover from it; it makes no difference what you may do, that uneasiness will always be with her. When you go about the cows, whether it be in the stable, lot or pasture, be gentle and kind. Speak to them, pat them, talk to them. Never lose your temper, if possible, as no one will lose by it except yourself. When you have to reprimand the milker, never do it before milking. He may be ever so good a milker, a good worker, clean about his person and stables, yet the cows will know there is something wrong with him, and seem to do mean things which would be overlooked at any other time. We are all human, and a cow does not lack much of being human also. Treat her as a human and never give her anything to eat which is not good enough for yourself, if you were in her place. Learn this lesson, and never forget it. Be gentle, be kind.—Colmon's.

THE MILKING MACHINE.

From New Zealand comes the report of a new milking machine that is being installed in one of the dairies. The new machine does not follow the pulsating method at all, but milks by the pressure of air bags on the teats.

The process of milking is a silent one, and the milk is drawn thoroughly, according to witnesses of the operation of the new machine. It is planned to milk twelve cows at a time with this machine, and with it but little power is required. The owners of the new invention claim for it the following points:

As compared with all suction machines:

1. The teat is not congested by the unnatural action of vacuum as a milk extractor. Hence the cow "lets down" freely instead of resisting, and therefore (a) there is no need for hand stripping; (b) the cow is not "dried off," and (c) no harm whatever is done if the machine is left on longer than needed.

2. Cleanliness—the milk does not pass through rubber tubing.

As compared with all known attempts at non-suction machine:

1. Absolute softness of fluid pressure as contrasted with pressure of anything solid.

2. Absence of wheels, pistons or other mechanism in region of teat.

3. No harnessing around the cow's body is included in the attachment.

Warranted to give satisfaction.

For Sale Our Herd Bull Sargent Fox, 64833
As we have dispersed our herd, except a few heifers for home use, we are forced to offer for sale this valuable sire. We will sell him at a low price to a breeder who is in a position to give this bull a chance to make a record.
Leffingwell Rancho. Inc., Whittier, Cal

CATTLE MANGE.

Writing to his friends in Scotland, a manager of a large ranching company in the Alberta district says: "It would be extermely foolish to take off the embargo on Canadian cattle entering Britain, as the home cattle would soon get infected with mange. Although the cattle are compulsorily dipped twice a year, yet the disease is not cured— only kept back. There are," he explains, "two kinds of mange—the wet and the dry—the former being the worst, and incurable. When housed, cattle infected by the wet mange smell very bad, and soon rot and die." Even were the embargo removed, the ranchman, in the opinion of the writer of the letter, would benefit little and it might be his undoing altogether. Were mange to appear in the old country, Canadian fat cattle, as well as stores, would not be permitted to be landed at British ports, and were this to happen we might pack up our traps and clear out.

COLORING OF BUTTER.

In response to an inquiry by a dairyman on the butter-coloring question, the following reply was received from the chief of the United States Department of Agriculture, Bureau of Chemistry, which will interest dairymen generally:

"Replying to your letter of recent date, I beg to say that the coloring of butter is specifically permitted in the law of August 2, 1886. It is held by the department, therefore, that the food and drug act does not repeal the provisions of the act referred to above; that the addition of harmless color to butter may be practiced as therein provided; and that the presence of the coloring matter so employed is not required to be declared on the label.—F. & F.

Publishers' Department

MORE RECORD SMASHING.

WE ARE compelled once more to announce the smashing of all advertising records in the history of the Cutlivator.

The last issue, March 7th, contained seventy-five columns, and a little more. The subscriptions also continue to come in with gratifying frequency. This makes us feel particularly good, for two reasons; one being the additional prosperity which accrues to the Cultivator business department, and the other the indication of confidence on the part of our subscribers and advertisers.

THE LINERS.

WE INVITE especial attention to the unusual increase in liner advertising. On October 4th our liner department contained six different advertisements. On January 10th, it had jumped to eighteen different ads, and on March 7th the department showed forty different liner ads.

There is only one other department in the paper which shows so great an interest on the part of the readers, when it is well patronized, as does the liner advertising. We desire to make this department one of the strongest features of the paper, and would urge our readers to pay particular attention to these little business announcements. You will very often find exactly what you want offered for sale in these columns, in the line of bargains, which could not be advertised in the more expensive way, because the money transaction would be so small that the larger expense would not be warranted.

The attention of all of our subscribers and readers is also directed to the value of these liners in disposing of small quantities of anything which they may have to sell. The small price of one and one-quarter cents per word makes it possible to put in an advertisement costing twenty-five cents, which will help you to dispose of something which you have to sell, and also help somebody else to obtain just exactly what they want. We desire to make this department a medium of exchange between the readers of the Cultivator, and to that end solicit a trial from any one who has anything to sell, to exchange, or who desires to buy anything whatsoever.

THE LEGAL DEPARTMENT.

THE other department to which we refer is that of Queries and Replies. The extent to which this department has been made use by readers in the past, is a clear indication of its value, and we invite questions on all topics covered in all our departments from anybody who is a regular reader of the paper, or from those who desire to become such.

The new subdivision of the Query Department, which appeared for the first time March 7, has already proven its value, and the large number of questions on legal points which have been answered by Mr. Fall in the last issue, indicate that the people welcomed the opportunity to secure legal advise on small matters which are constantly coming up on the farm and ranch and in the poultry yard. Do not hesitate to send in your inquiries when there is anything of a legal nature that you wish to know. Of course, there are limits beyond which it would be impossible to go in answering questions, but you will always be sure of a courteous reply to any questions which you may send. Especially to the new-comers in California will this department be of value, as there are many points in which the laws of California differ from those of the eastern states.

SPECIAL LIVE STOCK EDITION.

AS HAS been previously announced, the Cultivator will issue a special edition devoted to the Live Stock and Dairying interests.

The date of this issue will be March 28th. We invite special inquiries to be answered in this issue, and also advertising.

The other departments will not be interfered with, but especial attention will be given to Live Stock and Dairying.

Advertising should be arranged for as soon as possible, in order to receive the best attention. Articles of special interest will appear, and we shall be glad to receive any communications, which would be proper for such an issue.

OUR VETERAN NURSERYMEN.

WHEN John Rock was alive he held the proud distinction of having been in the nursery business longer than any other man in California and used to banter his rivals a great deal about it in his merrier moods.

There were several who nearly rivaled Mr. Rock in the claim for pioneer glory, and next to him in the line stood Tim Carroll of Anaheim who started his nursery in 1868. The two were great friends and had the same open-hearted bluff way of dealing with all comers, which was characteristic of most of our early settlers.

John Rock has passed away, but Tim Carroll is still with us on the old place, as hearty and hale as ever, annually turning away trainloads of fine nursery stock which goes to beautify Southern California; especially such palms as Phoenix Canariensis and Washingtonia robusta, of which tens of thousands are planted each year. There is hardly a tree or plant in the nursery line that this large establishment cannot furnish, and the long experience of the proprietor has brought the stock up to the highest standard possible to attain. We feel that no one should buy ornamental stock without first corresponding with the Anaheim Evergreen Nurseries, the proprietor of which is now dean of California nurserymen.

White Wyandottes.

THE 1907 catalogue of the Capitol Avenue Poultry Farm is on our table. It contains thirty-two pages of business-like information about the prize-winning birds of this well known farm with a number of half-tone illustrations, and twenty or thirty letters from satisfied customers whose names are well known. Address, A. L. R. Mantz, R. F. D. 21, Box 98, San Jose, Cal.

Lady (to new milkman)—I hope I can rely on the purity of your milk. Mr. Smith's became two-thirds water.

Mr. Jones—You can rely on this, mum. It's been paralyzed by the public anarchist.

Separator News.

THE Springtime issue of The Separator News, the big semi-annual publication of The Sharples Separator Company, West Chester, Pa., is now being sent to readers.

The News consists of six pages, standard newspaper size, illustrated in colors, and is packed full of facts and information about Tubular separators and the dairy business—a big feature being the testimony of Tubular users.

The News circulation for the present issue is 600,000 copies, sent all over the United States wherever dairymen live, and the mailing out of which keeps a big force of people busily engaged for a month. A postal request addressed to The Sharples Separator Company, West Chester, Pa., will bring the News to the homes of those within the United States. Free.

Hen's Eggs Wanted.

We've always had the "pie habit"—now we're coming into the lime light as egg eaters. Each year eighty millions of hungry Yankees want more "hen fruit" than sufficed for the previous year. It's really getting to be quite a serious question how we're going to get 'em fried, poached, and scrambled in quantities sufficient to satisfy us. Supply doesn't seem to keep pace with demand—which fact accounts for the other fact—that lots of times we don't get any eggs at all.

Now if you travel about the country and keep your eyes open, you will be convinced that there are hens enough in sight to give every man his "two soft" seven mornings in the week, if each hen did her full duty. Which observation brings us right square to the point where the "screw is loose"—they don't do it—no fault of the hens either. The real trouble is, the hen-man doesn't know his business, or else he neglects it. He doesn't treat his hens in the way self-interest would seem to dictate. You can't expect a lot of hens confined in a closed house or yard, with no systematic or rational effort to supply what they would get in a natural state, to make a profit for the owner! Now if you are planning to make your whole living, or even your "pin money" out of hens, there are two or three things you should certainly remember. First, don't be satisfied wuth scrub hens. Second, (and here is the real point) don't attempt to keep them without giving a regular daily ration of a good tonic. Nothing in hen culture gives so large a return as this one thing, and the only tonic to use is Dr. Hess Poultry Pan-a-ce-a, prepared by Dr. Hess & Clark, of Ashland, Ohio, and sold by all dealers. This has been the experience of all successful poultrymen. This preparation is not a stimulant, like pepper or something of the kind that excites unnatural production for a time.

Dr. Hess Poultry Pan-a-ce-a does its work in a different way by assisting the hen to fully digest her food and send each element to its proper part in the hen economy. Thus a daily feed makes bone, flesh, feathers and eggs, each to the extent of proper elements in the food. Dr. Hess tells us that Poultry Pan-a-ce-a is a true scientific preparation. It is the result of painstaking experiment in his own yards. So certain are Dr. Hess and Clark of the wonderful value of Poultry Pan-a-ce-a and Instant Louse Killer, that they cheerfully give a written guarantee that it will do all they say. If it doesn't you get your money back. Considering cost of ingredients and and care taken in manufacture, these goods are remarkably cheap. It costs but a penny a day to feed 30 hens.

Worth $100 to a Utah Man.

Parowon, Utah.

The Lawrence-Williams Co., Cleveland.

My son-in-law used about half a bottle of GOMBAULT'S CAUSTIC BALSAM on his horse for curb, and he says it is a sure cure and no mistake. He says it has done him $100 worth of good. JOHN S. HYATT.

JUSTIFIABLE PROTESTS.

WE HAVE recently received several protests against statements contained in the advertisement of the Lindcove Realty Company, with a request that we publish same. We herewith publish two of them and also a letter from an experienced Portrville orchardist to whom we wrote for information.

The statement that orange orchards three years old will pay big profits, is based of course upon the theory and upon such terms that at the end of three years, the man who has bought the land can receive a big profit in the advance in land value.

The same explanation can possibly be made in regard to the statement that a ten-acre orange orchard will pay from $800 to $1000 net profit per year per acre. Most real estate advertisements put forth the strongest inducements, and make the strongest statements possible in their advertising, for the purpose of locating inquirers, and it is then only necessary for the inquirer to carefully examine his contract before purchasing.

It is possible for a real estate firm to sell real estate, which at the end of three years will pay big profits. But the man who expects to reap a big profit from a crop of oranges from an orchard three years old, will be very foolish indeed.

The company stoutly maintains that they can assure the profits claimed and we have no proofs to the contrary, so leave the matter with our readers to judge for themselves.

We expect reliability in the reports, opinions, advices and to a certain extent advertisements that get in the Cultivator. Such an advertisement as the Lindcove Realty Co. should not have a place in your paper.—C. P., Redlands.

I wish to take exception to the publication of such on outrageously misleading advertisement as appears on page 219 of the current issue of the Cultivator. To say the least the writer of that adv. has an unlimited credit at the Bank of Imagination and overdrafts are permitted.

In the first place, the first statement is not true. Orange groves 3 years old will not pay profits anywhere.

In the second place, any one who is persuaded to purchase orange groves of these people with the expectation of making "$800 to $1000 net profit per year per acre" will discover that instead of an orange grove they have been handed a lemon. In behalf of the uninitiated and of other advertisers who wish the high standard of the Cultivator continued, I protest against such rabid wanderings in advertising guise.—C. B., Redlands.

"Referring to your letter just received concerning the Lindcove property will say: A tract of that name has been laid out between Exeter and Lemon Cove. Such yields as the advertisement claims are unknown in this section. The average gross returns for an acre of oranges will be about as follows: At 7 years from planting, 2½ packed boxes per tree; average price $1.50 per box (this is high); 108 trees per acre. You will see that this gives a gross return of $405.00. This is clear of packing and selling expenses, but you must deduct: pruning and fertilizing, $25; cultivating and irrigating, $25; water, $10; picking and delivering, $21.50; interest on invested capital, $1000 per acre at 6 per cent., $60; total, $141.50. Leaving the net profit $263.50 per acre. Having been secretary of a packing association for six years continuously I claim that I ought to know some thing bout it.—Porterville.

The Ornamental Garden

By ERNEST BRAUNTON

WATER GARDENS.

THE simplest arrangement for growing aquatic plants is a collection of large tubs or half hogsheads located in a sunny position and partly filled with soil. A much better plan is to make a pool by excavating the ground two or three feet.

The walls should be made of brick, stone or concrete, and the bottom covered with concrete, using cement for all the work. There should be a waste-pipe at the bottom with a standpipe for overflow. In a basin eight or ten feet across quite a variety of plants may be grown, using wooden boxes or shallow tubs to hold the soil.

Those having fountain basins in their grounds can utilize them in the same manner. It is not necessary that there should be a continuous flow of water, but during the growing season enough should be run in each day to prevent stagnation and to keep the plants in health.

While most water lilies will flower freely in contracted quarters, they will attain greater perfection with much larger flowers if they have abundance of room both for the roots and the leaves.

Ponds twenty to thirty feet in diameter or even much larger are desirable for growing a good collection. In growing Nelumbiums in the same pond with Nymphaeas care must be taken to confine the roots of the former to a given space, as they have the habit of spreading in all directions.

Soil.

The majority of aquatic plants are gross feeders, and it is well nigh impossible to make the soil too rich for them. It is not necessary to go to a swamp or a natural pond to obtain what is suitable. It can be prepared upon your own premises.

Any soil which will grow good vegetables, will, if properly enriched, grow aquatics. A compost consisting of two-thirds good loam and one-third thoroughly decayed manure is what we recommend. If you have a black, friable loam which is intermediate between adobe and sandy loam it would be excellent for the purpose. Commercial fertilizers are often used with good results.

Poultry manure two years old in the proportion of one-sixth manure to five-sixths soil is excellent for Nymphaeas but should never be used for Nelumbiums.

Hardiness.

In the Eastern states aquatics are classified as "tender" and "hardy." The hardy varieties are of course equally suitable for cultivation in any part of the west as in the east.

There are some districts in California so highly favored in the matter of freedom from frost that the tomato plant and other tender vegetables may be successfully grown in winter.

In such localities tropical aquatics may be left out the entire year. But where a lower temperature is the rule, they should be taken from the pond in autumn and wintered under a glass-covered frame or in a warm greenhouse.

Planting.

Wooden boxes, varying in size according to the space available and the requirements of the plants, should be placed at intervals about the pond. Fill them with the prepared compost; then tread it with the feet.

After planting the roots, cover the soil with a layer of sand to keep the manure from rising. Boxes from 18 inches square to 3 feet square or more may be used.

For several years we have been using a liberal top-dressing of gypsum (land plaster) to our beds and boxes of lilies and lotus. It is applied to the surface of the soil after the annual overhauling of the pond in spring, and while it is empty of water.

It is used in addition to the other fertilizers and is beleved to have a beneficial effect upon the growth of the plants. Also to assist in keeping the water clear and free from green scum (confervae) during the summer.

If this confervae persists in appearing, an extremely weak solution of sulphate of copper may be applied to the water with a syringe.

SPIRIT OF BEAUTY.

"To those who are verily awakened to the great worlds of truth and beauty, the universe daily becomes a sublimer miracle. Not a summer cloud sleeps in the blue air, or unfolds its pure fullness, or melts in the distance, but they are dissolved in a luxury of contemplation and think of Him who spread above us the glory of cloudland wherever we are, and when all around us is tamely wearisome. Not a landscape lies dreaming in the sunshine, and slowly expands itself to the passing gaze, but they are intoxicated with a more fiery sense of beauty until their vision often swims with tears of gratitude for existence, and the heart is ready to break with weight of blessedness. Their souls overflow with the 'glory of the sum of things.' Every flower that looks up, and every star that looks down, smiles to them the smile of God; and every stream that dimples away, or thistle-seed that floats in the noontide, bears them onward to limitless seas of thought and joy."—Henry W. Parker.

THE FLOWER-GARDEN.

But the person may want a flower-garden. Very well; that is a different matter. It is not primarily a question of decoration of the yard, but of growing flowers for flowers' sake. It is not the furnishing of a house, but the collecting of interesting and beautiful furniture. The flower-garden, therefore, should be at one side of the residence or at the rear; for it is not allowable to spoil a good lawn even with flowers. The size of the garden and the things to be grown in it must be determined by the desire of the person and the amount of time and land at her disposal; but a good small garden is much more satisfactory than a poor large garden. Prepare the land thoroughly, fertilize it, resolve to take care of it, select the kind of plants you like; then go ahead.

The Vegetable Garden

By ERNEST BRAUNTON

THE HOME GARDEN.

EVEN where the ornamental surroundings of the home have been neglected, a fairly well-kept garden in which are grown a number of the staple kinds of vegetables is generally to be found. In many cases the principal interest in the garden is manifested by the women of the household and much of the necessary care is given by them.

A small portion of the garden inclosure is generally devoted to the cultivation of flowers and a number of medicinal plants are invariably present. Throughout the newer parts of the country one finds that the conditions governing the maintenance and use of the vegetable garden are somewhat different, and, while a number of vegetable crops may be grown somewhere on the farm, there is wanting that distinction so characteristic of the typical New England kitchen garden.

It would be impossible to make an accurate estimate of the value of crops grown in the kitchen gardens of the United States, but from careful observation the statement can safely be made that a well-kept garden will yield a return ten to fifteen times greater than would the same area and location if devoted to general farm crops.

A half acre devoted to the various kinds of garden crops will easily supply a family with $100 worth of vegetables during the year, while the average return for farm crops is considerably less than one-tenth of this amount. A bountiful supply of vegetables close at hand where they can be secured at a few moments' notice is of even more importance than the mere money value.

Fresh vegetables from the home garden are not subjected to exposure on the markets or in transportation and are not liable to become infected in any way. Many of the products of the garden lose their characteristic flavor when not used within a few hours after gathering. By means of the home garden the production of the vegetable supply for the family is directly under control and in many cases is the only way whereby clean, fresh produce may be secured. The home vegetable garden is worthy of increased attention, and a greater number and variety of crops should be included in the garden.—W. R. Beattie.

SHIPPING VEGETABLES.

It is often profitable and at all times interesting to compare our own shipping methods with those of other sections, more especially those of similar climate. The following directions are taken from a bulletin published by the North Carolina Experiment Station:

"It is of the greatest importance that the products of the market garden should be put into an attractive shape for market. Green onions, beets and other crops that are sold in bunches should be properly washed and neatly tied in bunches with strings of raffia and packed in barrels.

Asparagus must be bunched in the regular buncher and the bunches made of the regulation size. Asparagus is shipped in flat crates just high enough to admit of the bunches being stood on end on a layer of damp moss and covered with another layer, the bunches being set in so closely that they cannot jostle and get out of place.

Cabbages are shipped in barrel crates with a partition in the middle. Beans and peas and lettuce in bushel baskets with a cover held tight with wire hooks. If lettuce is grown of fine quality under glass it will pay to ship in the Southern carriers holding about two dozen heads. These will sell in direct competition with the hothouse lettuce of the North, and will bring more money than lettuce grown under cloth and shipped in baskets or barrels.

A neat and attractive package always pays, and an honestly packed package will always tend to make a reputation for the grower, while a poorly culled sample and dishonest packing will always give the grower a bad name and a lower price for his articles. Never ship culls of any sort unless the market is very high and culls can be shipped as culls and pay.

Muskmelons are shipped in crates, and they, too, should be rigidly culled and no over-ripe or green specimens sent. The grower who always sends a good article, well-packed in neat packages, will always make better prices than the man who tries to work off an inferior article by hiding it in a package, surrounded by good specimens, for the only man he cheats will be himself with this last sort of packing. Always ship to a commission merchant who has made a reputation for fair dealing, and who has a good bank standing rather than an unknown party. While there are rogues in the commission business, there are honorable and responsible men, and these you should find out and stick to."

COLD FRAMES AND HOTBEDS.

The most common use of glass in the garden is in the construction of cold frames and hotbeds.

The difference between a cold frame and hotbed is that the cold frame is merely a frame to hold the glass sashes over a rich bed of soil, for the protection of some plants in winter and for the hardening off of tender plants that have been started in a hotbed or greenhouse.

The hotbed, on the other hand, is provided with some means of artificial heat, usually an excavation for holding a mass of fermenting manure, though sometimes a furnace is placed at one end and a fine run through a hot-air chamber under it, making what is known as a fire hotbed.

This last is but a poor compromise for a greenhouse, which can be built nearly as cheap, and is vastly better. In fact, the small, narrow greenhouse has now almost superseded the hotbed of any kind for all the purposes for which a hotbed can be used, being much more convenient and effective, even in a mild climate like California.

SEEDS PER ACRE.

The amount of seeds per acre is much the same in all climates, and for all time. That old veteran, Peter Henderson, after a life-long experience, recommended the following:

Beets, 5 to 6 lbs. per acre; snap beans, 2 bushels; cabbage, one ounce for 2000 plants; cucumbers, in hills, 2 to 3 lbs.; kale, 2 to 3 lbs.; watermelons, 4 to 5 lbs; onions, 5 to 6 lbs; onions, for sets, 30 lbs; onion sets, 6 to 12 bushels; peas, 2 bushels; potatoes, 10 to 12 bushels; radishes, 8 to 10 lbs.; spinach, 10 to 12 lbs.; tomatoes, one ounce for 1000 plants; turnips, 1 to 2 lbs.

Mrs. Barred Rox—Will the delegates from the Leghorn Society be allowed to vote in the Mothers' Congres?

Mrs. Brahma—Indeed, no! They are only lay members.

BORDEAUX POWDER.

Bordeaux Powder is now made for the vegetable garden by dissolving 10 pounds of sulphate of copper in four gallons of hot water, adding to this a solution of five pounds of lime to four gallons of water. Stir this till no green streaks appear and scatter it into the lime dust made by slacking the balance of a barrel of lime. Mix with a rake, sift and spread out to dry. This makes about 250 pounds of powder.

Charles C. Navlet Co.'s New and Wonderful

Seedless Blackberry

The Handsomest, Finest Flavored, Earliest Ripening and Most Profitable Blackberry in the World

50c per Plant, 12 for $5.00
Delivered Free

Chas. C. Navlet Co.'s Seedless Blackberry is absolutely, unquestionably, superior in every way to any other Blackberry yet introduced. It commences to produce its luscious fruit fully four weeks earlier than any other Blackberry and is at its best when the other varieties are but just beginning to ripen. It is juicier and of a more delicious flavor than any other Blackberry. It is larger than the well-known Kittatiny, Crandall or Lawton, takes fewer berries to fill a basket, is far more attractive in appearance, finds a readier market and commands a higher price. If planted this spring and properly watered and cultivated, it will bear a small crop the first year—no other variety will produce fruit until the second year. It begins to bear fruit, if the season is favorable, between the 15th and 30th of May, and produces its heaviest crop in June and July. While not entirely seedless it is nearly so, and the few seeds it has are round and so small and soft that they are not in the least annoying. If you give it a trial we are sure you will think as highly of this wonderful Blackberry as we do.

Our handsome Illustrated Bargain Catalogue of California-Grown Flowering Plants, Farm Seeds, Flower Seeds, Berry Plants, Fruit Trees and Ornamental Trees will be MAILED FREE to any address upon request if you mention the Cultivator.

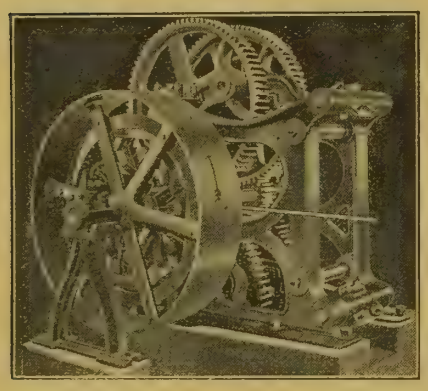
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Irrigation and Pumping

DUTY OF WATER.

THE soil on the Twin Falls tract is commonly considered to be of volcanic origin, varying from two feet to an unknown depth, consisting of very fine particles.

When we began work on the Twin Falls experimental farm in 1905, we dug prospect holes from seven to ten feet in depth in order to determine the character of the soil, and the amount of moisture present.

The only difference we observed in the soil was that the first foot was somewhat darker in color. With regard to moisture, the first eighteen inches contained some moisture, but below it was perfectly dry, consequently we irrigated before planting. It required twenty-four to thirty-six hours to saturate to a depth varying from seven to ten feet.

No effort was made to determine the quantity of water used during the season after that. This year (1906) it was determined to measure the amount of water used on the farm, and the amount running off as waste, as well as the evaporation, with a view to determining the quantity of water necessary to keep the soil in proper condition.

The miners' inch was used in measuring half a cubic foot per second of the farm, and a device was employed in connection to obviate any fluctuation in the head. A weir with an automatic register attached was used as a check on the miners' inch measurement in order that we might be sure that just the amount of water desired was supplied.

At the lower end of the farm a weir register was installed for measuring the waste. Elias Nelson of the Bureau of Irrigation and Drainage Investigation added an evaporating tank.

We began irrigating May 2, with the amount of water allowed under the contract between the settlers and the Twin Falls Land and Water company—that is 1.80 of a cubic foot per second per acre, continuous flow.

The amount of water applied during each month up to the first of September, 1906, is given below, as well as the waste and evaporation:

Total amount applied, 36.10 inches; total percentage, 100 plus.

Total amount precipitation, 0; total percentage, 12.4.

Total amount wasted, 4.49; total percentage, 7.4.

Total amount evaporated, 28.06 total percentage, 77.7.

Total per cent. wasted, 7.4.

Total per cent. evaporated, 77.7

Total difference (or water retained by the soil), 5.694 inches; 15.8 per cent.

The waste during the month of July was was greater than any other month. This occurred while we were irrigating the lower tier of plats, and no opportunity was afforded whereby we could again use the waste. The farm consists of 40 acres, and being an experimental farm, there are a great many different crops grown, requiring water at different times and in varying quantities.

The evaporation almost equaled the amount of water applied during this month, less the waste and evaporation as shown by the evaporating tank.

Assuming that the evaporation from the water-free surface in the tank was equal to the amount evaporated from the ground, plus the amount used by the crops, we can have some idea of the amount of water actually required.

No doubt if less water had been applied, the results, as far as the crop production is concerned, would have been the same or greater, as was indicated by some tests made by Mr. Nelson, showing that the third foot of soil lost much less moisture in a given time than the first or second foot. The roots of certain crops penetrate to a depth where they would be able to draw upon the moisture to a greater depth than the shallow rooted ones.

If all the crops grown had been of the kind that could have been cultivated, thus conserving the moisture, I am sure much less water would have been required.

Taking the four months, or 122 days as the irrigating season, we used water twenty-four days nine hours in May, twenty-six days in June, twenty-two days and nine hours, in July, and twenty-three days and two hours in August, leaving twenty-six and a half days during the irrigating season when water was not used.

These results show that 1-80 of a cubic foot per second continuous flow is more than necessary at Twin Falls, where the soil is very deep.

I believe if the land were given a thorough irrigation late in the fall, thus storing the moisture in the soil for use the following year, it would be a great saving of time and labor, and materially lessen the amount of water used during the irrigating season, besides being more economical, and as the surrounding areas become moistened through irrigation, with proper cultural methods, less and less water will be necessary each year until half the amount used this year will be sufficient.

Just what the duty of water will be on the Twin Falls tract a few years hence, I am unable to say, but I believe that it will be far greater than now, as the people are becoming educated in the use of water, and find that less water and more attention to the soil give greater and more, beneficial results. This fact was demonstrated this year on a portion of the experiment farm, where last fall it was irrigated late, and only one irrigation was required this season to produce 70 bushels of wheat to the acre and 96 bushels of oats.

The character of the soil and the lay of the land should indicate the best method of applying water.

Two methods have been tried on the Twin Falls tract—flooding, and by furrows or corrugations. After a thorough trial, the corrugation method has been given the preference, and fully 90 per cent. of the farmers have adopted this method.

I believe that it is the better of the two, especially when annual crops are grown, such as grain, etc. While it is true that some others claim that the duty of water is greater by flooding than by corrugation, that has not been by experience in the portion of the arid district where I am located.

As it is understood that water only goes into the soil under pressure, and that plants practically stop growing when the air is excluded, which is done by flooding, this is objectionable.

Then again we understand that plants only use the ascending or capil-

Any lamp—no matter how good—is handicapped if it hasn't the proper chimney.

My business is manufacturing lamp-chimneys that fit perfectly—of clean, clear glass that won't break from heat.

My name—MACBETH—goes on every one.

My Index tells of lamps and their chimneys, fully and interestingly. Let me send it to you—it's free.

Now is the time to go for gophers with **Bille's Gopher Poison.** The gophers go for it and it will go for them good and plenty every time.

This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us.

We do not send less than 2 bottles.

Compounded under Bille's patent by

We pay freight or deliver from San Francisco

ary moisture, consequently the ideal way of applying water is to do so without shutting off the air, or causing the soil to bake, which is the result more or less if flooding is followed in this section.

This is especially true of nearly all crops excepting grasses. Then again, water is more easily applied by the corrugation method than by flooding, and if the corrugation system is properly constructed, water can be applied so that it will run night and day with less labor or care, and with comparatively none, if any, damage to the land.

I consider the corrugation method the best for applying water, at least on this tract, or any other tract having the same conditions.

I will try to describe the system I have advocated to the farmers on this tract, the great portion of whom have followed the advice given:

First, the land is graded, so that the water will not be turned from its course in the corrugations by the high places. It is not necessary to have a perfect outline, but there should always, necessarily, be fall enough so it will continue on its course.

We then run the corrugations or small furrows two feet apart in the direction in which the water is intended to flow. Cross ditches are then run at right angles with the corrugations from 300 to 500 feet apart, according to the grade or fall of the land. Check boxes are put in each cross ditch, the distance apart being governed by the fall of the land. The sharper the pitch, the more check will be necessary. The nearer level the supply ditch is, the less boxes will be required, and within a reasonable limit, will carry sufficient water to irrigate the land intended.

Check boxes are so constructed that the water will flow over and not under the splash boards. The water is raised by these splash boards as high as needed, so that the water between the check boxes, when raised to full height, will stand on a level, the excess water being allowed to go over the splash boards, and be caught up by another check box.

To divert the water from the cross ditches into the corrugations lath boxes are used—each of these boxes will supply from one to three corrugations, depending upon the pressure in the cross ditch and the length of the corrugations.

Four laths will make two or three boxes, according to the length required. The laths are simply nailed together in the form of a square, and cut into two or three sections, as the case may require. The boxes are then placed in the bank of the ditch, the top of the lath box being a little below the level line of water, so all will receive the same pressure, and flow steadily night and day. If they are kept clear, they will remain in position for service indefinitely.

Three thousand laths will make enough boxes to furnish one for each corrugation on a 40-acre field, the field being cut into three sections.

Boxes in the head ditch for the section below control the drain water from the section above, so that all drain water is picked up and redistributed further on down the field.

When check boxes and lath boxes are set in place, the land being properly graded, irrigation is no longer a task. Under this system, with a regular head of water, irrigation becomes automatic

The condition of the soil on the Twin Falls tract is such that it takes about 12 hours to properly irrigate a field in each section, as above indicated. On many so arranged farms, irrigation is looked after twice a day—in the morning before work commences, and in the evening after work is over.

It can readily be seen that irrigation under the above system is not a task, but in reality a pleasure. When flooding is practiced, especially on new land, the water is hard to control, the cost of labor is increased, and damage to the land from water is probable.

Moreover, it is dangerous to attempt flooding at night. By the corrugation method, water can be applied night as well as day with perfect safety.

Besides, under the corrugation method, there are no pools formed in low spots—the land receives water uniformly, in the way and manner desired.—Alex McPherson, Twin Falls, Idaho.

The English Walnut in the North

Continued from page 267

cription of this nut, states: "It is very large, with a light colored shell of moderate thickness, kernel plump, readily extracted whole, sweet and rich nutty flavor. Tree blooms late and is very productive. An old and standard French variety." At the present time we have very few genuine Mayette trees in bearing in our state.

Parisienne.

Named after the city of Paris, but was originated in southern France and is now quite extensively grown in that country, and, with Mayette and Franquette, forms the bulk of the crop. It is a large nut of about the same size and proportions as Mayette but is more truncated at apex and does not bulge out as much in the center. It is sometimes slightly ribbed, and the pits, while numerous, are shallow. The valves are not pronounced. The kernel separates very easily from the shell. The pellicle is very light—from a straw color to nearly white.

The convolutions are much as in Franquette and veins are quite pronounced. The kernel is smaller than that of either of the aforesaid nuts. In quality it is very good. Those who have seen this nut in the Prince orchard at Dundee are very much impressed with it, although Mr. Prince himself is as yet not quite sure that it can rank with Mayette and Franquette. These three nuts are promising from a commercial standpoint.

Chaberte.

Named after its originator. A medium sized nut, very flat at the base, and at the apex pointed in much the same way as the Franquette. The shell is thin, often to such a degree that it will not stand shipping in sacks, but must be crated. The kernel is smaller than that of the three above described nuts, but of about the same color as that of Mayette.

It separates very easily from the shell, and this fact, with the small size of the kernel, makes it a favorite with confectioners. In quality, the meat is rich-flavored and oily. Because of the large percentage of oil, it often is grown for this purpose. It is the hardiest of our French varieties and has grown at an elevation of twenty-seven hundred feet. It will also thrive on poorer soil than most of the other varieties.

Proepurturien.

Named because of its precociousness. The nut ranges in size from medium to small. In form it is something like a small Franquette, without the pronounced valves. It is a vigorous dwarf variety, often bearing in the third year, but only the grafted trees keep these characteristics. The seedlings tend to revert to the larger, less precocious, tree. In quality it is very fine and makes an excellent home nut, It is free from disease and is productive. Mr. Felix Gillet has introduced two improved strains, namely, the Large Pointed, and the Late, Proepurturien.

Meylan.

A French variety that originated near the village of Meylan and is quite extensively grown in that region. This is a large nut, flatter and slightly broader than Mayette. The pits on the shell, however, are not so pronounced. Quite recently introduced into America by Felix Gillet. This nut can be seen growing in the orchard owned by Mr. Prince and is a very promising nut, being smooth and of a fine form. It is somewhat lighter in color than most nuts.

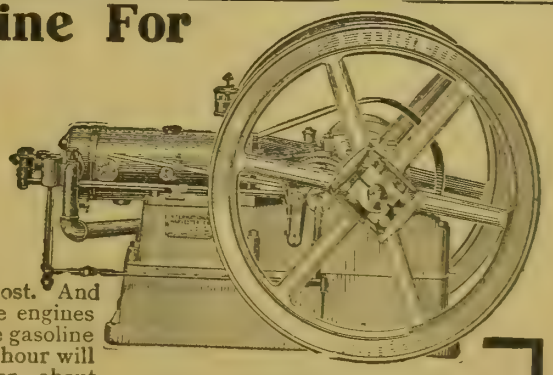
Get an Easily-Operated Engine For

IRRIGATION PUMPING



WHEN you buy an engine for irrigation pumping you don't want to get one that will require an engineer to run. What you want is an engine that will practically run itself for hours at a time. One that is sure and safe and steady, one that is simple in construction, and easily understood and operated.

I. H. C. Gasoline Engines are that kind, and for that reason are especially adapted to pumping for irrigation. A small boy can look after an I. H. C. Engine, and run it as successfully and economically as anyone. Look it over once or twice is all that's necessary in a day's run.

Now, what else do you want in an engine for irrigation pumping?

Economy—To be sure, you want an engine that will pump the largest amount of water at a small cost. And here again I. H. C. gasoline engines fill the bill. Ordinary stove gasoline is the fuel, and the cost per hour will be about 1½c per horse power—about 45c a day for a three-horse power engine working 10 hours. That's cheap enough isn't it? And convenient. You can buy gasoline by the barrel, and always have plenty of fuel on hand.

Durability—Because I. H. C. engines are simple and strong in construction, they are durable, too. There's nothing much about them that can wear out. Repairs are small and inexpensive; parts can always be readily obtained, and you can replace them yourself.

Ease of Operation, Economy, Durability—these are three good points that help give I. H. C. gasoline engines a superiority over others.

If you are now using any other power, or if you are planning to pump for irrigation this year, go to our local agent and examine these famous engines. They are made in various styles (Vertical and Horizontal, Stationary and Portable) and in sizes ranging from 2 to 20-horse power. During the seasons when not in use for pumping they can be made to serve in a hundred other ways.

Call on our Local Agent or write nearest general agency for illustrated catalogue.

CAR SHORTAGE.

Answering the criticisms relative to car shortage in California the Southern Pacific states the present condition from its point of view. Some of the declarations made are as follows: At the present time the Southern Pacific has several thousand cars in Oakland and San Francisco which it is doing its utmost to get unloaded. When fifteen to twenty per cent. of the rolling stock of a railroad is tied up at one point famine elsewhere occurs.

Extreme measures have been taken to relieve the situation and it is thought with the rapidly improving warehouse facilities in the city and the better conditions for teaming that within a short time the trouble will be a thing of the past.

The criticism that there has been great congestions in yards and on mail lines, because the track room was not sufficient to care for the increased business, is answered by the statement of the S. P.: "that 7000 locomotives were built in 1906 compared with an average of 4300 during the preceding five years. During 1906 nearly 241,000 cars were placed at the disposal of the Southern Pacific and other railroads in the country. During the same period the Southern Pacific has increased its trackage 1100 miles, or thirty per cent. over the total for 1905."

While these explanations extenuate the Southern Pacific, they do not relieve the car shortage which is costing the shippers an immense sum of money. It is estimated that over 4000 cars of oranges are going to decay in Southern California today. The Southern Pacific is not alone in its shortage, the same state of affairs exists on the other lines, and the question is what can be done to relieve the situation. Apparently we are increasing our producers faster than the railroads can take care of our product. The only solution to the problem of transportation seems to be a government transcontinental railroad to be operated more as a freight carrier line than for passenger traffic.

CALIFORNIA STATE FAIR.

Prof. Wickson writing of the State Fair for 1907 says:

"The next California State Fair promises to be great. It will be held from September 7 to 14. It is expected that the Executive Committee of the National Irrigation Congress will fix the date of the meeting of that congress, in Sacramento, the same week as the State Fair. With these several thousand delegates from all parts of the United States, the inducement to display products by way of showing to the visitors what California can do, will be very great. President Roosevelt is expected to come West to visit and inspect the Roosevelt dam in Arizona, and will be invited and urged both by the Irrigation Congress and the State Fair officials, to extend his trip into California and visit the State Fair. All this looks very promising for the popularization of the project, now what will the farmers and stockmen do to make it not only spectacular but agricultural? That is a very important question, which all individuals and associations in the agricultural line should take up seriously."

If the management of the State Fair will get busy and do its part, at the same time see to it that a square deal is given all exhibitors, from hotel accomodations to transportation on the railroad, the greatest fair in the history of the state will come off. Prospects for a wonderful prosperous year are in evidence and the farmers will be in splendid shape to make exhibits and to attend the fair.

SUGAR AS FOOD.

With the changes which have come from experiments with different articles of diet sugar has taken a strong advance. A few years ago there was a wide-spread conviction that sugar is not a healthy addition to dietary, but from modern investigation this idea has well nigh became obsolete. It has been shown that used with moderation sugar forms one of the most wholesome articles in table use. The governments of Europe, as well as our own government have added sugar to the rations of their armies, and the results of several years use have placed it among the highest articles in the daily rations of soldiers. It has been shown from experiments that pure candy is healthful for children when not used to excess and fits in with fruits exceedingly well in all stages of child activity. The Minnesota Exepriment Station has issued a bulletin on the subject. Among other things the bulletin recites: "In the dietary, sugar is frequently regarded as a condiment instead of a nutrient, to be used for imparting palatability, rather than for purposes of nutrition. While sugar is valuable for improving the taste of foods, its main worth is as nutritrive substance. From the caloric determinations of the foods used, of the feces, and of the unoxidized products of the urine, it is estimated that 98.9 per cent. of the sugar was oxidized and made available to the body. Thus, for all practical purposes, sugar may be regarded as entirely digested. Being composed of the elements carbon, hydrogen and oxygen, it forms when burned or oxidized carbon dioxide and water and as a result heat is liberated. The sugar used in these experiments when burned in the calorimeter, yielded 3.995 calories or heat units per gram, or approximately 1.800 calories per pound, which is about the fuel value of starch and allied carbohydrates. As a heat and energy producing nutrient is fully equal to starch, and is more readily absorbed by the body."

Sorghum has proven a valuable adjunct to cattle feeding and in Texas is now generally used in the finishing of stock for the market. The meat of beef cattle fed on sorghum is sweeter, more nutritious and less fibrous, than the meat of cattle finished entirely on grain. For this reason feeders in the South, and even in Kansas and Oklahoma are using molasses to a much greater extent that in former years. From present indications the human family and the animal kingdom will be fed sugar a great deal more plentifully in the future than in the past.

COBURN OF KANSAS.

Second only to Secretary of Agriculture, James Wilson, of Iowa, in the estimation of the farmers of the United States, stands F. D. Coburn of Kansas, who from his long and successful career as an agriculturalist has been denominated "the farmers' friend."

Probably no man in public life has written a greater variety of bulletins and books on farm topics, not exerted a wider and more beneficial influence on the people of his time who are interested in scientific farming, than the secretary of the state board of agriculture of the great commonwealth of Kansas. His writings have became authority so far as they pertain to Middle West conditions to every agricultural college and newspaper in the Middle West territory.

Not long ago the governor of Kansas tendered him the appointment of United States Senator to fill the place made vacant by the removal of Burton. This honor was declined because Mr. Coburn said he could better serve his state in his present capacity than in the Senate of the United States. Since 1880 he has, with but short interim, been Secretary of the Board of Agriculture of his adopted state, and it is probable that Kansas has received more wide-spread advertising through his efforts than any state in the Union. His writings have attracted thousands upon thousands of enterprising farmers to his state and the helpful suggestions he has given them have had much to do in placing Kansas in the front rank of western states.

To sum up the subject of this brief editorial it may be said, Coburn, of Kansas, is a great big man. Capable of filling any position anywhere.

When James Wilson leaves the cabinet of the President, no better man in the entire country can be found to succeed to his portfolio, nor one who would so well please the masses as of the farmers throughout the country as, Coburn of Kansas.

CONVICT ROAD MAKERS.

A suggestion has been made that our criminals be used as road makers. Instead of housing them in jails and feeding them until their sentences are served, put them on the public highways and let them work out their fines.

There are some reasons why this idea might be followed to advantage. The average criminal would be better off if he were put to work than he would be if allowed to lay in jail. It would cost a little more to guard him, but he would be paying for his keeping in a substantial manner. Several states are looking into this subject and convict labor, both from the penitentiary and the common jail, is being advocated for road making. Supervisors in California counties may find suggestions of value in the idea, not only as a remedy for keeping out the vagrant class, but improving his physical and moral condition by giving him some strenuous labor in doing service to the state.

CALIFORNIA STOCK.

The February Crop Reporter states that on January 1, 1907, there were 391.680 horses in California, valued at $36,120,721, or $92 per head. Mules 80,750 valued at $8,599,875 or $106 per head. Milch cows 405,615 valued at $14,196,560. Other cattle 1,167,107 valued at $21,474,767. Sheep 2,422,426 valued at $8,006,170 or $3.31 per head. Swine 550,581 valued at $3,909,125 or $7.10 per head.

Better packing of oranges and other fruit for export would greatly help American trade, according to the reports of various consuls in Europe. One consul makes an excellent suggestion as to packing apples in boxes instead of barrels. It would save the oranges from damage which cannot well be avoided when they are packed in barrels.

The Cultivator trusts the delegation in Congress from California wil do everything possible to further the National Grange road bill. The farmers need it. California as a State needs better roads—vastly better roads. Stand together, for this bill and let our representatives see we are a unit for it.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Chino has had two feet of rainfall.

Highland's rainfall to date is 21.71 inches.

Rainfall at Hemet far measures 14.69 inches.

Total rainfall to date at Pomona is 25.25; total fall for season ending June 30, 1906, 23.33.

Farmer's Institutes will be held in Ventura, Fillmore and Pomona late in May or early in June.

For the last storm the precipitation at Redlands was .71 of an inch. This makes 19.04 inches for the season.

The rains of the past three weeks have almost completely destroyed the Moorpark apricot crop about San Jose.

The express shipments for the week from Escondido were 241 cases of eggs, 1700 pounds of poultry, 600 pounds of butter and 1980 of cream.

The rainfall resulting from the last storm was 2.72 inches at Ontario which brings the total for the season up to 21.76.

The precipitation of the late storm amounted to 1.25 inches, making a total of 14.95, as against 10.80 for last season to date, for Escondido.

February was a short month, but in spite of that fact the output of the Imperial creamery showed a growth of 25 per cent. during the month.

More than 700 acres of land, good farm land at that, has been sold in the Santa Maria Valley to home-seekers since the first of the year.

The heavy rainfalls have caused Lake Hemet to overflow the Hemet Dam, and in consequence over 5000 miner's inches of water are going to waste.

The packing-houses are hard at work with the oranges, but owing the car shortage, shipping is slow. Several carloads are ready for the cars when they arrive.

Tomatoes are to vie with potatoes in the Yuma valley this year. Scarcely a ranch is without a small plot of ground in which tomato seeds have been planted and small plants grown.

Twenty-five hundred acres of beets for the Chino factory are already planted, of which 350 are on the Chino ranch. They are coming up nicely and within a fortnight thinning will begin.

For the first time in years, the Covina packing-houses are running full blast on Sunday, as the ranchers are anxious to take advantage of the excellent prices now in the eastern markets.

On account of the heavy rains during the past week the orange shipments have been somewhat retarded at all points. On an average of twenty cars a day have been removed from the Covina packing-houses on fine days.

"George," she said, "before we were married you were always giving me presents. Why don't you ever bring me anything now?"

"My dear," replied George, "did you ever hear of a fisherman giving bait to a fish he had caught?" Then the kettle boiled over.

HORTICULTURE.

The rainfall at Poway this month to date is 1.13 inches, making 13.69 inches for the season.

Rainfall up to Tuesday night, 3 inches, making a total of 23½ inches for the season at Fillmore.

Mr. Sherman Stevens has been setting out 25,000 orange trees for a nursery stock on his place in Tustin.

So far this season, or from the first of December there has been in all 141 cars of fruit shipped from Rialto.

The car shortage crippled the shippers at Ontario considerably, the fruit being on hand for at least 300 cars.

The season's rainfall at Ventura now amounts to 24.31 inches. To the same date last season 10.97 inches had fallen.

The rainfall for the last storm at San Bernardino is 2.32 inches. This makes the total rainfall for the season 20.39 inches.

The total shipment of citrus fruits from Highlands, East Highlands, West Highlands and Patton to date amount to 686 cars.

The Tustin Packing Company is still shipping about a car a day. They have sent out two cars of lemons and the rest are seedling oranges.

Stone Brothers have placed an order for 800 Bartlett pear trees which they will plant on the border of their farm in the Mesquite lake district.

March shipping at Ontario will be crowded to the limit and 450 cars must be shipped in order to properly care for the immense crop of oranges.

Wide awake apple growers about San Bernardino are making preparations for fighting the codling moth by putting their spraying apparatus in order.

A few of San Bernardino's deciduous orchards used smudges on the late frosty nights. Examination shows that there was little or no damage done.

The Citrus Fruit Association at Ontario shipped in February seventy-five cars of oranges, while the shipment for the whole colony amounted to 200 carloads.

Total shipments from Ontario of oranges and lemons for the whole season is estimated at 2000 carloads, being an increase of 600 cars over last season's output.

The Rialto trustees have secured 2000 eucalyptus trees to set out on the new school premises. The plan is to set four rows along the north side and two rows on the west side. These will not only protect but will at the same time be useful for fuel.

OPPORTUNITY.

They do me wrong who say I come no more
When once I knock and fail to find you in;
For every day I stand outside your door,
And bid you wake, and rise to fight and win.

Under present conditions the most profitable dairy cow seems to be the one that helps make the most butter in winter.

Northern California

AGRICULTURE.

Salinas has a 3-legged colt in good healthy condition.

The tule land in the vicinity of Rio Vista and Isleton is rapidly coming to the front as an early asparagus district.

The last rain at Redding makes the season record 28.06 inches. At even date last year the record showed 22.37 inches.

Two crates of asparagus from Isleton shipped to Philadelphia last week sold for $25 each, the crates weighing twenty-four pounds each.

The American Beet Sugar company announces the attractive feature for the coming season of a bonus of 25 cents a day for all who remain with it during the season.

Manager Nash of Winters is preparing to set out 75,000 tomato plants on the cannery grounds and will later transplant them to a 100-acre tract, the cannery has rented on the T. A. Sparks ranch.

The land of William J. Kaseberg, facing the county road to Pleasant Grove for a distance of three miles, will be sub-divided into forty-acre tracts and sold to small farmers.

Application was recently made to the Department of the Interior on behalf of the Sisson section asking that a portion of the water supply of the middle and south forks of the Sacramento river and Panther creek be utilized in the irrigation of about 10,000 acres of land in this vicinity.

Causes of Bitter Milk.

The question is often asked, says a writer in Successful Farming, "What makes milk and cream get butter in cold weather without getting sour?" And having asked the question, makes the following answer: Milk or cream at very low temperatures will sometimes become so bitter it is unfit for use. Though you have put it in cold water at once and reduced the temperature, and though it may have frozen later, yet you are troubled week after week with bitter milk and cream.

All troubles in milk, except those due directly to bad flavors received from filth or absorbing bad odors, are due to some form of bacteria. If there were no bacteria in milk it would keep indefinitely. There are certain kinds of bacteria that multiply by spores. Whenever that occurs the bacteria are hard to get rid of. Spores are to bacteria as seeds are to cockle burrs. It isn't a hard matter to kill the weed, but the seeds may live for years in the field before they get a favorable chance to sprout, thus the almost endless task of eradicating them. Bacteria are minute plants. Those that multiply by spores (seeds) are easily killed, but the spores live through severe conditions and grow as soon as conditions are favorable. Thus the trouble is hard to get rid of.

Bitter milk bacteria can be killed by ordinary scalding of cans and pails, but the cans must be given a very thorough washing with washing powder and brush, then sterlized with much boiling water or steam in order to kill the spores to the trouble will not start up again.

Freezing does not stop the growth of this bacteria, though it does stop milk souring bacteria from multiplying, hence your milk and cream becomes very bitter in cold weather and not get sour. Absolute cleanliness is the remedy.

HORTICULTURE.

The olive crop at Fair Oaks this season was a good one.

Total rainfall to date at Vacaville, 19.91; rainfall at same date last year, 19.11.

The rainfall to date at San Jose is 15.52 inches, against 9.40 to the same date last year.

Prunes are not yet out in blossom in the Santa Clara valley, except here and there in occasional orchards.

The owner of the nicest grove in the town of Colusa, says that this season's crop nets him between $700 and $800 an acre.

A great many people in California are unaware of the fact that Colusa county produces such excellent oranges, and yet it is a fact.

A small orange grove near Colusa was recently sold at over $500 an acre, while the same soil nearby but unimproved can still be had at around $100 an acre.

The building of a winery near Roseville has greatly stimulated the planting of wine grapes, and it is expected that a large acreage will be set to grapes.

The last rain storm at Saticoy measured 1 1-4 inches, which makes a total for the season of 24 inches, against 3¼ inches for the same date last season.

The attention of all pear growers is again called to the pear blight and the fact that all "hold-over" must be cut cut before the leaf-buds open and the flower-buds bloom.

A new industry of the Santa Clara valley is to be established this coming season, when pitted prunes will be one of the features placed on the market by local packers.

The heavy downpour in the Santa Clara valley ended what chances there were remaining of a fair apricot crop, as the trees were in blossom and the rain destroys the pollen.

For the present storm up to 7 o'clock .91 of an inch of rain had fallen at Watsonville making a total of 29.68 inches for the season. The prospects are for more showers tonight.

Announcement has been made that more of the Kaseberg estate near Roseville will be placed on the market as soon as surveyed. The estate consisted of 28,000 acres of fine grain and fruit land.

The pear growers of Green Valley feel jubilant over the present condition of the pear orchards, as very little blight is in evidence this year and the trees present a much healthier appearance than they have done for the past two seasons.

The Vacaville district has furnished the following fruits for the last season: Prunes, 4000 tons; Peaches, 800 tons; Ruby Prunes, 300 tons; Figs, 200 tons; Pears, 100 tons; Pitted fruits, 100 tons; Total, 5,500 tons. Averaging twenty tons to a car this would amount to 275 carloads.

A poor cow can be made to pay her way at least by liberal feeding. It is equally true that a good cow may be made to lose by "stingy" treatment.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hasard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

WOMAN'S WORK.

"MAN'S work is from sun to sun, woman's work is never done" was the rejoinder to the question, "Whatever were you doing in the middle of the night?

"Mother heard a chicken cry, and knew something was the matter, so she went out to put it to bed again; they sometimes tumble out and get lost, especially on moonlight nights."

"You don't mean to say that you got out of your warm bed and went out to the brooder house in the middle of the night, just to make a chicken comfortable?" said my Eastern friend in a tone of mournful surprise. I could see she looked upon me as a hopeless case; in fact pitifully weak in the upper story or a monomaniac as far as chickens were concerned.

"That is just what I did," was my laughing reply. "Of course no one likes to hear a chicken or a baby cry, especially in the middle of the night, but it was not merely a matter of sentiment on my part; it was also a matter of dollars and cents."

"How much is that chicken worth?" was the next question.

"About fifty cents; it is a thoroughbred White Rock."

"I fail to see where your dollars come in; it seems to me you are carrying things too far!"

"Wait till you are a chicken fancier, then you will understand!"

When She is a Chicken Fancier.

When she is a chicken fancier, she will know that if I had left that baby chick out from under the warm hover, he would have taken cold and next day would have been feverish and walked around all humped up alternately drinking water and shivering, and at night he would have felt so lonesome and sick that he would have crowded up against or under some of his brothers and sisters and some of them would take the infection from him, and the next day they would increase and half of the chickens in that brooder or perhaps all of them might be sick and there would be a mysterious "taking off," a lot of deaths, and perhaps none would recover sufficiently to ever be great, vigorous fowls.

Little Things.

If you want to succeed with fowls you must look after little things, learn to hear and understand the different cries. They have about eight different "peeps." One for hunger and another for fright; one for cold and one for sorrow. Have you never seen a little chick stand and look around and cry pitifully? He has lost his little chum and will not stop till he finds him. Yes, they have their little chums and their little games and sometimes their little fights, too Learn to hear and understand their cries and their wants, and you will make a success of the chicken business.

What to do.

But suppose I had hardened my heart, turned on my pillow and gone to sleep, leaving the chick to fare as best he could, what would I have done the next day. For one thing I would have felt provoked at myself, and then I would have carefully looked over the chicks until I found one that stayed under the hover, or up in a corner hunched up, or with his head down acting sleepy. I would have taken him right away from the others, put him in a warm box with a bottle or jar of warm water, fed him some bread and milk with some cayenne pepper, and kept him for a day or two and if he was not well then, killed him. Never leave a dumpy chick in with the others. Kill it or keep it by itself. If you have several you might put them under a hen or in another brooder, but never leave them with the others or all may be infected. A cold, especially an influenza cold, is very infectious. The germs are communicated in the drinking water, as well as by breath, by the discharges of the nostrils and by the droppings. One sick ailing chick is a little bit of poison, going about poisoning the others unintentionally but surely.

Causes of Mortality.

Why do some people have "bad luck" with their brooder chicks? Or in other words, what is the cause of mortality amongst brooder chicks?

Sometimes chicks are badly hatched in the incubator and the trouble commences there, or even earlier, in the hens that laid the eggs. But granted that chicks are from vigorous parents and well hatched, whence the great mortality?

There are a number of causes for mortality among brooder chicks, the limited space of one page will not permit me to describe all of them I will mention a few.

Overheating or Chilling.

During the first few days this so weakens the bowels that the yolk of the egg which has been drawn up into the bowel cavity during the last day in the shell, cannot be assimilated or digested. This is the case when chicks are fed too early in life.

The last day the chick is in the shell the yolk of the egg or so much of it as has not been used in nourishing the embroyo is drawn into the bowel cavity and remains there till it is digested which should be within three days unless something occurs to prevent it.

Anything which weakens the bowels, such as over-heating, chilling, feeding too soon, or feeding without grit, are the usual causes for the non-assimilation of the yolk, and if the yolk is left too long it putrifies and brings on blood poisoning, diarrhoea being the first symptom of this.

Impure Water.

Another cause of mortality is impure water, many a promising lot of brooder chicks have died solely from being obliged to drink warm, dirty water whilst the owner has laid it to his or her "bad luck," or has comforted himself by thinking that the diarrhoea must have come from a cold.

Over-heating.

Over-heating from crowding as the chicks grow larger, is one of the most fatal causes. The chicks will sweat off in one night all they have gained during the day and will be stunted in growth if they do not die.

Draughts, imperfect ventilation, insufficient sunshine in winter, or in hot weather not enough shade, improper feeding, especially too little green grass or vegetables, a lack of

grit and last, but not least, tuberculosis, all conspire to kill our chicks.

Tuberculosis.

Tuberculosis demands more than a passing notice, for I believe that at least 20 per cent. of the deaths among brooder chicks are from this disease. Tuberculosis thrives in foul air and darkness. We take great pains to have a circulation of pure warm air in our incubators, and then confine our chicks to the dark, close air of pipe brooder system. Are your brooders so made as to furnish an abundance of fresh pure warm air and do you keep them clean? To get good results we must have clean brooders free from germs of any kind. They must be supplied with plenty of sweet air; they must be kept clean, and they must be opened as often as possible to the direct sunshine. The best destroyer of the tuberculosis germ is sunshine and fresh air.

Rhode Island Experiment Station.

The Rhode Island Experiment Station states in a report on this subject: "The simple expedient of removing the hovers and setting them out-of-doors in the full sunshine reduced the evidence of tuberculosis in 50 per cent. to only 3 per cent." It also says: "For guarding against tuberculosis, give the interiors of the brooders all the sun and air possible on pleasant days."

Dr. N. W. Sanborn in his book on poultry diseases writes: "During the past winter I was asked to visit a broiler plant where the percentage of deaths from some new disease was very large. I found that under apparently the same conditions in previous years there had been a much lower death rate. The chicks as they came from the incubators were large and healthy.

"There were few deaths until the third week. The chicks seemed to thrive for a while, then in tens and twenties, would lose appetite, become dumpish, grow thin and die. Of the chicks brooded in the dark days of January, 50 per cent. died. Examination showed little change in the gizzard or bowels. The livers were slightly darker than in health, but the lungs were soft and gritty."

These were tuberculous chicks from infected brooders, and the only thing to do was to clean up the brooders and keep things in as sweet a condition as possible, and arrange to start next season with brooders free from germs. Wash your brooders with good, hot, scalding hot, soap suds, and air them in the sunshine. Keep disease out, it is easier than fighting it, when once it gets a foothold.

INDIAN GAMES.

Anything with a strong dash of Indian Game blood in it is hard to beat.

Any bird which is brought to a strange place should not have the right eggs put under her for two days at least, so that it can be seen whether she is going to take finally to the nest selected for her. A nest egg or two will do all that is required for that time.

When a brood hen is selected where should she be set? Some quiet out house, free from drafts, will do nicely, and as such places are usually not too well lighted; so much the better. Every setting hen should have a darkened place to set in, otherwise she may leave her nest much too frequently. The nest itself may be formed in a box of suitable size, or it may be made in the soil of the floor, provided such soil is clean enough in every way. Earth is always a necessity in the formation although sometimes a fair hatch has been made from eggs incubated on dry boards covered with a little hay. The latter is by no means to be recommended, as sufficient outside moisture is not to be obtained in this way. A turf can be cut to fit the box, keeping the grassy side upmost and scooping out some earth from the center, afterwards pressing it into shape in the box, so that the sides will gently slope to the center. A good lining of short hay should be put inside. A slightly damp turf is a very good thing for the purpose, but if a good one can not be got a shovelful of rather damp earth should take its place and be beaten into shape, and afterwards lined with hay and put the eggs therein. A good many nests can be formed quite close to each other in this way.

Before setting a hen, it is a good thing to see that she is free from vermin. A thorough dusting with insect powder a day or so before putting the eggs under her, and another one four days before the chickens are due to hatch, will insure that the latter will be free from these pests for some time to come—a practical necessity if the birds are to thrive from the start.

No more eggs should be placed in the nest than the hen can cover fully. If too many are placed under her, first one and then another will be left uncovered, with the risk of a very poor hatch occurring.

Good shaped eggs should alone be used for hatching purposes. They should be sound and smooth in shell, and of good size. Very large eggs sometimes prove infertile.

SHORT CUTS TO PROFIT.

Writing in The Industrious Hen, Mrs. Livingston says:

"I am impressed with the fact that there is not sufficient thought given to minimizing labor in our large poultry establishments.

As a business the unit should and may be 2,000 birds and a competent superintendent may be able to count on that as one man's labor and at a profit at any price that has prevailed for productions within the writer's knowledge.

There is no doubt that this number or unit may be, under favorable conditions to 2500, possibly 3000 birds. This means that the feed account for their maintenance must be supplemented by the cost of one man, that wage being effected by local conditions.

New, it will be quite evident to every poultryman that to be able to accomplish this that the method of housing his birds is the point which makes this possible or impossible. It is quite as impossible to expect to locate a poultry plant intended as a business, at any point picked at hazard as it would be to start a brick yard. And to establish one with a reasonable assurance of profits it is quite as necessary to give the same consideration to location for one as the other. This does not apply to the man or woman who wishes to keep 50 or 100 fowls for such profits as they may secure from that number, but those profits will be proportionately affected by a disregard for the location of their egg and broiler factory. I could mention several poultry plants at a great loss, but it is no fault of the business, but of the architect of that particular plant and were we to sit down and figure the cost and cause of the losses it would

Chicks Just Hatched — **We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States**

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.
Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.

CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

When writing advertisers, mention Cultivator.

be an easy matter to put the finger on the exact causes. The birds are not at fault, it is "the man behind." For him who is just entering the business it is easier to avoid these rocks of failure than for him who has made his start, to find it false, because the moral courage required to recognize a mistake in what was probably christened as a pet theory is considerable, and the cost to the pocket to correct this mistake is also considerable.

Profits Large.

There is no branch of agriculture where the profits are so great as in the poultry end and there is no branch where so little advance has been made toward improvements in its management as a business as they should be. There will be another rush to get into the business as there was to the gold field in '49, because, for the few the profits will be nearly as great.

In ten years there will be as great a change in the accepted requirements of poultry as a business, as between the old hen and the incubator and the men and women who are first to recognize the necessity of conforming to these requirements will be those "in on the ground floor" and who will reap the fortunes.

The changes in the future of fortunes for the poultryman are only now becoming apparent when the place of these changes necessary become so, but there is no doubt whatever that in another generation the oft repeated statement that "there are no fortunes to be made with poultry" will be entirely disproven.

In this day where a ten thousand hen plant is a very fair sized 'chicken yard," the time is not far distant when this will be one of the smaller ones, and the profits of the larger will also increase when we have taken hold at the right end and open our eyes to necessities as yet recognized by but a few.

But then the fortunes made by the "cotton kings" will fade as wonders and the great American hen will prove a greater factor to wealth than we now have any idea. The interesting problem of the present moment is who will be the Rockefeller's, the Armours and the Vanderbilts of the poultry?

ON BREEDING GEESE.

Old geese lay a greater number of larger eggs and are more reliable than young geese. Nevertheless, if geese must be purchased, it often saves time to buy young geese rather than attempt to secure any number of old ones. Young ganders are better for breeding purposes than young geese. Young geese do not lay as many fertile eggs or produce as many goslings the first breeding season as they do the second. If geese are often changed from one place to another, they are apt not to breed well, and other conditions being equal, they breed better the third season they are in a locality than the second.

In order to insure the best results, geese for breeding should be obtained as early in the fall as possible, not later than October. They thus have an opportunity to become acquainted with the new surroundings before the breeding season. Breeding geese should have considerable excercise and be kept moderately thin in flesh through the winter by light feeding and a free range of facilities for swimming. The best ganders for breeding purposes are African and Brown China. The Toulouse geese lay well, but often do not sit. The Embden greese lay fewer eggs but make better mothers. Brown China and White China geese are prolific layers. Geese are graziers and too much grain is not good for them. To insure fertile eggs they should have access to a pond or other body of water. If this is not possible a tub of water set level with the surface of the ground may be substituted. Very early laying is not desirable, since the goslings do not thrive well unless they have an abundance of grass. For the first two or three days they should be given nothing except grass and water. Later a little feed of scalded cracked corn should be given in addition three times a day. The goslins are liable to be overcome by the heat, and should always have some place of retreat where they may escape the sun's rays.

The eggs may be hatched advantageously under hens, but the goslins should be immediately taken away from them. They may be brooded for a short time in outdoor brooders and after that confined in houses at night.

Mating.

I have a choice Barred Rock hen that I have mated with a vigorous young cockerel, I expect next year to mate her with one of her sons and the pullets with their father. Beyond this I am somewhat muddled as to the proper matings in order to establish a flock of "line-bred" fowls. Kindly explain the proper steps to take.—G. B., Upland.

It would entirely depend upon the results of your first and second matings, the results of which nobody could possibly foretell, especially not knowing the parent birds. You would probably have to establish a double mating, keeping one pen for cockerel breeding and another for pullet. All you can do is to wait and see the results and then get someone who is a good judge to look at your fowls and tell you which colors (whether dark or light) you should mate together, also which shapes, whether blocky or rangy.—Mrs. A. B.

"This bread isn't fit for a dog to eat," growled the husband.

"Very well, dear," replied his wife; "don't eat it, then."

ROUP IN TURKEYS.

A subscriber complains that his turkeys are affected with swelled head, culminating in blindness, each season. Fresh stock has been secured from other yards only to become similarly affected. It would seem that there must be germs in the yards or coops if the stock has been entirely changed and only healthy fowls were purchased, or else there are conditions about the roosting place which cause the trouble. I never knew of turkeys that roosted on the topmost bough of a tree being affected as this subscriber describes it. Roup is like consumption—develops most readily in quarters which are not reached by sunlight and where crowding and close confinement are practiced. Giving fowls an abundance of fresh air without subjecting them to any drafts, and yet affording them ample protection from the weather, is a problem that has not yet been satisfactorily solved. If lumber were cheap enough, so that we might put but ten fowls in one house or apartment measuring 10x10 feet, we might defy roup.

Illustrative of how roup cures work, last September a fine Rock hen took her brood of chicks outside the coop, and was caught in an all-night rain—a regular downpour. In the morning she was breathing with that croup-like whistle that poultrymen know means serious trouble. Against my better judgment, I commenced treating her, for her brood of chicks would have been motherless; so I soaked her head and throat in kerosene, carefully protecting her eyes; then I swabbed her throat and head with the same, using a feather and reaching up into the cleft of her mouth and well down in the throat. I put her under a crate in the sunshine, and in an hour the distressing whistle ceased. She has appeared as well as ever until a week ago, when the painful breathing commenced again. I repeated the oil treatment, but shall never use her for breeding stock. I will kill her as soon as all signs of roup disappear.

I would begin with new stock once more if I were the party with the diseased turkeys. I would if possible get a gobbler from wild stock, as they are more hardy. Then I would have trees, perches and coops sprayed with carbolic acid or a strong solution. I would have all yards plowed deep or spaded. Be careful not to crowd the brood coops, and be sure that the perches are not in line with nail holes or knot holes, so that a draft of air can hit the fowls when on the perch, for the line between a simple cold and a dangerous case of roup that may become as malignant as diphtheria is very narrow.—Michigan Farmer.

PROFITABLE POULTRY.

In my last article I promised to give figures of our little poultry plant for 1906.

The Receipts.

Two hundred and thirty hens—January 205 dozen, February 197 dozen, March 286 dozen, April 206 dozen, May 191 dozen. Two hundred hens—June 158 dozen, July 119 dozen, August 130 dozen. One hundred and forty hens—September 123 dozen, October 108 dozen. Two hundred and forty hens—November 183 dozen, December 159 dozen.

Total 2065 dozen eggs.

Incubated 995 eggs. Chickens hatched 700. Cash received for eggs $525.30. Cash received for chickens and hens, $238.75. Total receipts, $764.05. Increase of hens 100, valued at $100. A profit of $75 more would have been received if a thief had not taken part in the business; but we got him, and he will not steal any more hens for ten years.

The Breeds.

I promised in my last article to tell of our different breeds and of their comparative egg productions.

A year ago this winter we had only Barred Rocks, of the Hawkins strain, and the Single Comb Brown Leghorns, direct from first-prize-winning stock of Milwaukee, Wisconsin, in 1904. Believing we had good stock of these breeds, we were anxious to know which would be the more profitable.

In September the Leghorn pullets began to lay, and in October were laying heavily, and in November the Rock pullets began to lay, so it is seen that the Leghorns had two months the start (of the same age,) but in December the Rocks were in the lead.

In the months of December, January and February the Rocks laid one-fifth more eggs than the Leghorns, so we concluded the Rocks were the better winter layers, and when eggs were highest, but in March the Rocks got broody and fell down, and the Leghorns got right down to business, and from March to January laid about one-fourth more eggs.

The Leghorns Best.

The Leghorns can be kept on one-third less feed than the Rocks, so they are about one-third more profitable for eggs but, on the other hand, the Rocks make better friers, and the Leghorns mature into nice broilers quicker, and when adult hens are to be turned off the Rocks bring one-third more; so we find that for us, eggs being a specialty, the Leghorns are about one-third more profitable.

Last spring we invested in one dozen White Leghorns that came from Wycoff, of New York. We also bought 100 of the White Rock eggs of a Northern poultryman. We are keeping an accurate record of eggs laid by the different breeds.

In my next I will give the figures, but will now state that the White Leghorns are far in the lead. I do not think there is much difference in the color of any breed, or breeds, as it is in the strain.—Farm and Floral World.

WOLVES AND STOCK.

The United States Department of Agriculture has in press and will issue in a few days Bulletin 72 of the Forest Service, entitled "Wolves in Relation to Stock, Game, and the National Forest Reserves," prepared by Vernon Bailey, Assistant in Charge of Survey.

The bulletin calls attention to the present abundance of wolves in various Western States, the losses suffered by stockmen on the western cattle ranges, and the destruction of game in forest reserves and in national parks, with suggestions for the destruction of the wolves. Among the protective measures recommended are bounties and wolf-proof fences. The means of destruction suggested are hunting, capture of the wolf cubs, poisoning, and trapping.

Only One "BROMO QUININE"

That is LAXATIVE BROMO Quinine. Similarly named remedies sometimes deceive. The first and original Cold Tablet is a WHITE PACKAGE with black and red lettering, and bears the signature of E. W. Grove. 25c.

POULTRY.

HARRISON'S R. I. REDS AND WHITE Rocks. The best out West; 12 awards at Poultry Breeders' Show, including 1st and 3rd Red cockerels, 1st and 2nd Red pullets in a class of 36 pullets; White Rocks 1st pen, 1st and 3rd pullets and 3rd cock. New circular. Eggs $2.00 for 15, $5.00 for 50, $8.00 for 100. LAKE AVENUE POULTRY YARDS, 757 N. Lake Ave., Pasadena, Cal.

FOR SALE—STANDARD BRED WHITE and Buff Leghorn pullets, $9.00 per dozen. White and Buff Leghorn hens, $1.00 each. One small Mann Bone Mill mounted on stand, $5.00; will exchange bone mill for White Wyandotte eggs for hatching. W. O. SHAW, P.O. Box 201, San Luis Obispo, Cal.

COLUMBIAN WYANDOTTES, THE FANCY and Utility Fowl. Eggs and stock for sale. Eggs from Pen No. 1, headed by First Prize Cock at late Los Angeles show, $5 for 13; No. 2, $3. Also Black Tailed Japanese Bantams, $4 per 13. Frank J. Ironmonger, Hollywood, Cal.

SINGLE-COMB WHITE LEGHORNS, FINE white, large, birds; good layers. Hatching and shipping chicks. Eggs for hatching; call and see, or write for particulars to MRS. D. F. STONER, Ontario, Cal.

BUFF ORPINGTONS—I WILL HAVE A few settings of Buff Orpington eggs to spare from best stock obtainable. From St. Louis and California prize winners. $3.00 per 12 eggs. MRS. N. F. MORSE, Fullerton, Cal.

PUPPIES.

FOR SALE—SCOTCH COLLIE PUPS FROM prize winning stock, sired by Brookmere Hopeful, noted Chicago and Detroit winner, and Dos Robles Towser, winner three firsts at Venice. If you want workers get a pup and teach him yourself, he will do the work of two men. Send for circular and pedigree. WALTER S. DAVIS, 337 South Spring street, Los Angeles. At stud, Brookmere Hopeful, Dos Robles Towser.

FOR SALE—SCOTCH COLLIE PUPPIES. Pedigree furnished with every sale. $15 and $25. Write for description. E. B. VARIAN, 539 Douglas Bldg., Los Angeles.

TREES.

FOR SALE—4000 VALENCIA AND 1000 W. Navels; one year buds on three year roots, clean and vigorous; buds taken from bearing trees. F. E. CHAPMAN, R. F. D. Box 34, So. Craig Ave., Pasadena, Cal.

FOR SALE—MISSION, BLACK SPANISH, and Taft's Kadola Figs; fine trees at 25c and 35c. Order quick if you want them. H. L. BAUER & SONS, 737 South Spring Street, Los Angeles.

PALMS, PALMS, PALMS. TWO YEARS old, field grown. Date palms, carefully packed with moss, 12 for $2, 100 for $10. SOUTHLAND NURSERIES, Redlands, Cal.

FOR SALE—20,000 EUCALYPTUS, READY for April planting. Write for prices. A. L. HURTT, San Bernardino, Cal.

WATERMELON SEED.

FOR SALE—FINE RED CHILLEAN WATER Melon seeds. Price 50c a pound. WILLIAM BRITTON, Burbank, California.

Will Not Breed.

I bought a standard-bred 4-year-old mare; about 3 months ago. I wanted to breed her, but so far have not been able to do so. She seems well, but has never shown to be in heat. Had her opened up, but it did no good. She has never been bred so far as I can find out; can you recommend anything. —N. R. B., Riverside.

The animal may be too fat, if so put her at hard work until thin, then breed her. Another plan is to stand her in a stall near a stallion, but out of his reach; this is likely to bring her in heat.—(Dr.)W. N. S.

Hollywood Table Grapes.

What are the best table grapes to grow against the Hollywood foothills where the soil is pure disintegrated granite to the depth of several feet?—A. L. R., Hollywood.

Cinsaut is a good grape for such a situation. We do not know of any better. Black Morocco is also a good one. The former is a mid-season grape and the latter is a late one.

Tarred Rope.

Will you please inform me how the vineyardists prepare tarred rope to tie up grape vines, so the rope will last until the vines are able to stand alone.—J. H. G., Newcastle.

Stir tar in hot water till you get a dark colored liquid and soak your rope in that.

Stop the churn as soon as the butter granulates if you want to work out all the buttermilk.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Spraying Grapevines.

I am writing you about spraying grapevines with Bordeaux mixture, to inquire as to results from your past experience along these lines.

We had some mildew last season and if spraying will help keep it out we want to spray.

If you can spare the time to answer a few questions we will feel very grateful to you and endeavor to profit by your past experience.

1. Do you spray grapevines and how often, once or more than once in a season?
2. When do you spray?
3. What solution do you use?
4. Do you spray the ground around the vine?
5. What has been your experience with muscat vines as to spraying?
6. When do you sulphur and how many times?
7. Should a person use bellows or will a sack answer the purpose?
8. When do you advocate pruning muscats? Last season some of our neighbors pruned in December and the first part of January and for some reason their crop was very light, some of the shoots did not come out until after most vineyards were well in leaf. The later pruning was much more satisfactory, or feast the crops seemed better.
9. Do you think vines pruned in February or the first part of March will give better results than earlier pruning?
10. Will the difference in the time of pruning make any difference in the time of ripening?

I am asking these questions as I have been unable to find any article in the Cultivator during the past year that gives me the information desired, as I always read it and am on the lookout for articles on these lines.

We are experimenting with the peach blight and so far have very little in our orchard. We sprayed good in November with Bordeaux; 15—25—100 and last week sprayed again with 8—15—100, and believe we stand some show of getting a crop.

The County Horticultural Commissioners were here yesterday and they said they found less blight in our trees than any others they had examined. I had a letter from Prof. M. B. Waite today and according to his directions we are doing all that is now known for the prevention of the disease.—H. B. B., Hanford.

1. One spraying has seemed sufficient for the needs of the vineyard. We have sprayed twice a couple of times, but it did not give us any better results.

2. Before the vines start to grow. We will spray this week if the rains hold off long enough to make it possible to run the tank on the vineyard. I had a young chap here a couple of years ago, that turned all the men to spraying on a showery day to save their time to the ranch. He was wise in his own conceit, but the rain washed the spray away before it ever had time to set. Choose a dry day or one at least when the indications are that it will be dry long enough to allow the spray to dry on the vine.

3. The old Bordeaux formula 4—4—40, or 4—4—50 is the one used for vineyards.

4. No, enough falls on the ground directly around the vine.

5. I believe in it most thoroughly, so do many of the best vineyardists in this neighborhood. There are three spraying outfits working on four vineyards between here and town. The fourth man has been here to borrow our outfit, so you see how general it has become.

6. When the vines need it. We often do not have to sulphur at all if the Bordeaux has been thoroughly applied. The rule is to sulphur when the vines have formed two tiny leaves, sulphur at blooming, and then again in three weeks.

7. The bellows by all means if applied by hand. There are now larger machines coming into use. The sack way is wasteful and does not put the sulphur into and under the leaves where it is needed.

8. This is a hard question to answer. Fifteen years ago we all practiced very late pruning, but the vines after a couple of years did not hold back and escape frost any better than those pruned earlier. It was only when the land was left uncultivated that the growth held back. Now to leave the ground baked that late is to invite sunburn, thrips and red spider.

9. We rarely are ready to prune the muscats before February as we prune the orchards first, and if by reason of rain, we are delayed in pruning until March we do not see that the vineyard either leaves out sooner or ripens any sooner than the first pruned portions.

Now my friend Prof. Bioletti does not think I am right in recommending the use of Bordeaux mixture for mildew. I think probably we are both right. While, as he says, the Bordeaux will not kill the hold-over spores of mildew, yet I believe that a clean grapevine is like a clean person, not liable to disease. We make the surroundings of them clean and destroy harboring places with Bordeaux; we are making it hard for the mildew to exist. I know a vineyard adjoining mine that did not have a renter for two or three years; the owner merely scraped over the ground and sold the crop to anyone on the vines. I had mildew in the row of vines next to this vineyard every year. This vineyard was sold and cared for well by the new owner. I do not have mildew along that side. Last year Dr. Sherman thought the spraying need not be done and when we came to pack Emperors there was mildew enough to make the culls heavy. We also had to buy sulphur at $75 a ton in Los Angeles and pay the freight, after the San Francisco fire.

I am glad you are having success with your peaches, the trees we sprayed in November look clean at present. We cannot spray them until the land dries enough to drive the spraying outfit on the land. It almost looks doubtful if we can give them the second dose at all.—M. E. S.

Hardpan.

Seeing an article in February 14th number upon reducing hardpan, I would like to ask some questions.

If all hardpan can be reduced except that formed by the cementing process, please inform me in what sort of soil the cementing occurs. Is it in the reddish clay?

After close observation, I am firmly of the opinion that hardpan is continually forming and if the soil is left uncultivated beneath the trees, as is the custom in some places, it will become harder and harder, until it can scarcely be broken, except by blasting, which I believe injures the trees. Does not hoeing and keeping the soil broken under the trees belong, rightly, to the regular cultivation.

Please answer in next number of the California Cultivator.—H. M. T., West Riverside.

The hardpan that affects the soil in West Riverside section is without doubt due to the lime that is present in the soil. This is quite noticeable in places where excavations have been made. The drainage has been from the lime rock hills in the Sky Blue Mountain section at some time and the deposit has been made at some remote time. The amount of lime is being constantly increased by irrigation water also, as water from the Riverside water supplies is full of lime. You are right that the soil should be stirred beneath the trees every year. There is no practical

way that I know we are aware of, whereby the hardpan that forms below the reach of the plow can be broken up.

The cementing process will take place in any soil when an excess of lime is found and is constantly being added to by the soluble form through irrigation water.

Walnuts in Fresno County.

Do you think the English walnut could be successfully grown in Southern Fresno county?—M. A. Reedley.

We took the liberty of sending this query to Mr. George C. Roeding, of Fresno, believing that he is better able to answer the question than anyone else, for he lives in the section the inquiry comes from, and his competency to answer is unquestioned:

"Your valued favor of the 26th inst. received, enclosing letter from Mr. M. A. of Reedley, California. In reply to same I beg to state that the walnut can be grown successfully in this valley, and there are quite a number of trees growing on my place and a number of other places, all of which are growing fairly well. In a general way, I do not think that walnuts can be grown as successfully here as they can in the coast counties and in Southern California, where they have fog and cool summer winds. As far as the flavor of the nuts is concerned, there is practically no difference between those grown here and those in Southern California. One fault found with nuts grown in the San Joaquin Valley, is that the pellicle covering the kernel is rather dark in appearance and this militates against the sale of the nuts. The walnut is also subject to the yellow mite, which is indigenous to dry climates, and it is necessary to dust the trees with sulphur in order to prevent them from being defoliated. One or two sulphurings in a summer season is all that is required. After the trees are eight years old, they do not seem to be subject to the attacks of this little insect as they do when they are young."

Bumble Foot.

Will you kindly answer the following question in the next issue of the Cultivator. One of my hens has a sore foot. It looks like a stone bruise. It is on the bottom of her foot, and is soft, but the skin is quite tough. She was a little lame when I bought her about a month ago, and has got worse lately. The roosts are 2 1-2 feet from the ground with soft sandy earth underneath them. What is the matter with her and what will cure her?—Mrs. S. P.

Your hen has bumble foot. In most cases bumble foot seems to be the result of a bruise, and is usually caused by the fowl jumping from a high roost on to a hard floor. It is often caused by an irritation, however, of some foreign body such as splinters, bits of glass or briars, foxtail or burrs.

A case caused by a simple bruise is often aborted by washing the foot in strong vinegar, or painting the thickened skin with tincture of iodine. Most of the cases which have come to my attention have developed puss. These should have the puss cavity opened with a clean, thin knife or lancet, the matter washed out with carbolized water, and the entire surface of the cavity itself painted with a solution of nitro of silver, ten grains to one ounce of distilled or rain water. Birds that have had the puss cavity opened should have the foot bandaged with clean linen and be kept on clean, dry straw for a week. It is very important to keep dirt and germs out of the wound.—Mrs. A. P.

Punctuation.

Please let me know who wishes the "uniform and correct system of punctuation" mentioned in the Cultivator of January 24. I think I could qualify. —Subscriber, Oleander.

The world in general would welcome such a system—who is yearning for it specifically we do not know, but inasmuch as there occur several misspelled words in "Subscriber's" letter, we doubt if he has the necessary educational qualifications to evolve it.

Planting Grapes at Imperial.

In your issue of the 21st. I notice that you advise planting table grapes 8 to 10 feet; would you tell me your reason for this, as after sixteen years of experience with the raisin grape (Muscat) in El Cajon valley it has led me to the conclusion that for economy in cultivation, picking, etc., 12x12 is the best plan.

Down east they plant the Malaga almost entirely and they tell me it makes a very large growth. If this is so would it not be better to plant them at any rate more than 8x10? It seems to me it would be difficult to get between the rows to make easy work, besides the fact of running water in so small a space and also of not being able to turn around in the vineyard with a team at picking time.—H. K., Imperial.

We got our information from an Imperial man who has quite an extensive vineyard. He told us that he planted his vines 8x10, and when we asked if it was not too close, he said no. He claimed that he got more grapes that way and that was what he was after. We were after information for a personal reason and that was what we got. It seemed to us that it was too close, but we do not like to put our judgment against another man's experience, especially when the conditions are entirely new and untried in a general way. We would like to hear from some more Imperial men who have had experience along this line.—J. W. M.

Split Apricot Trees.

Being only a beginner in the fruit business, my ideas may be erroneous, but I give them for what they are worth, and hope they may at least lead to some investigation by more competent parties.

Last year I had a 3-year-old apricot tree split down the main stem, so cut it off about fifteen inches above the ground. It has made a fine growth, throwing out branches a good distance apart and now it is pruned promises to be the strongest tree I have. I have two more this spring, which I have treated the same way, although four years old are already throwing out buds, which seemed to be dormant.

My idea is that in raising apricot trees, if at two years old the main branches are so placed that they will probably split, it would be best to cut the whole top off and start a new set of branches from the main stem.

Any suggestions on this subject will be greatly received.—F. W. C., Corralitos.

We have saved a great many apricot trees from splitting by going through the orchard and bolting suspicious-looking crotches. Mark the trees that you think may split, measure the length of the bolt needed and when you put them in, use a washer on the nut end. The nut and head of the bolt will soon be grown over, and as the crotch grows together, the whole bolt will finally disappear. It is impossible for a tree to split when so treated.

Budded Trees.

We would appreciate your advice in regard to nursery stocks for Oranges, Lemons and Satsuma plums—what seed to use, and how to prepare seedbeds, etc. Please answer through Cultivator and oblige.—C. F. R., Orange.

Pomelo or Sour stock are good for orange and lemon stock. Peach is the best stock for Satsuma plum where the land is well drained.

There was an article on Page 162 in the February 14th issue of the Cultivator, that gave directions for the making of an orange seedbed.

Peach pits should be buried in damp sand in the fall. As they begin to sprout, take them out and plant in the nursery row six inches apart. The rows should be four feet apart.

Black Walnuts.

I have several hundred pounds of black walnuts to dispose of and would like to know if it would be too late to advertise same; also how much per pound should I receive.—M. G., Arroyo Grande.

An experienced grower tells us nuts may be planted up to April 10th, but does not know the price per pound.

Old Trusty Incubator
On Free Trial

We will send you an Old Trusty on free trial for one, two or three hatches and pay the freight. If you find the incubator not exactly as represented, and if it does not do the work, return it at our expense. We have confidence in our machine or we wou d never make this offer.

Construction

Genuine 12-oz. cold rolled copper tanks, selected redwood lumber, double top and bottom, double walls, double doors, best lamp and regular made

Save $10.00 to $15.00

709 So. Main St., Los Angeles, Cal., and Eugene, Oregon

33⅓%

Is about the extra cost to the buyers of many of the ***cheap***(?) chick foods. Why? Waste—that's why. You buy a 100-lb. sack of so-called chick food, but if your chicks only eat 66⅔ lbs. and the rest is waste, have you not added 33⅓% to the price you paid?

The waste in many cases is lack of knowledge by the makers of what to use and the proportions to use of the various grains. In A. C. W. Chick Food you will find ***no waste.*** Your chicks will eat all A. C. W. and ***digest*** it. A. C. W. is put up in sealed sacks. Accept no substitute. At all dealers or direct from us.

EGGS Ringlet Barred Rocks $1.50 and $2.00 per sitting 15. Black Minorcas (Albert strain) $1.50, and $2.00 per sitting 15. Mammoth Pekin Ducks $1.00 and $1.50 per dozen.

EDWARD A. HALL, WATSONVILLE, CAL.

Magnolias from Seed.

Can you, or any of your readers, give me a pointer on propagating magnolias? I have experimented with seeds, but failed to have any sprout. And information on the subject will be appreciated.—M., Riverside.

The magnolia is a swamp plant native to the Southern states, and needs both heat and moisture, not only for starting the seeds, but also for the best development of the trees. The seeds do not keep well, and as a rule should be planted as soon as ripe. They usually have a glutinous substance surrounding the seeds, and this is best washed off, after which the seeds should be planted in a soil lightened by sand or leaf mold, or both, and should be kept wet at all times and as warm as possible. If on a hotbed, better results will be had. They are oftimes slow in generating, and one must be patient in keeping the soil in a proper condition of moisture. It often happens with eastern nurserymen, that seed planted in the fall, does not generate until the following spring.

Pruning Walnuts.

In pruning walnut trees; mine are two years old. They grew so fast last year, I had to stake them and the branches up out of the way. I have headed them too low and will have to cut back, or cut off lower limbs this season, and I am afraid again next year, for I think I will not be satisfied with the height of head after new growth comes out; wouldn't summer pruning be advisable when limbs lop down in this way?—H. S. T., Lordsburg.

The best practice is to cut off all branches that grow in the wrong place, as early as possible after noticing them. Go over the young trees in June and again in July and cut out all shoots that turn down or cross others; also drive a stout stake close to the young tree so as to tie up branches that you want to keep and which would otherwise grow down. This stake should be of 2x2 redwood and eight or nine feet long, and will do to keep the tree in place as well. Head your trees at about four and one-half to five feet from the ground.

Tule Pests.

Please advise me how to get rid of cattails (tule) that grow in a waste water ditch, without injury to the adjacent land, though for twenty feet on either side nothing is growing. —A. H. H., Riverside.

We know of no way to get rid of them except to dig them up. If the soil is well drained they will not again infest the land.

Beans.

Will you please let me know through the Cultivator if it is advisable to plant beans in a year-old vineyard, planted from cuttings. The soil is rich. What kind of beans would be best. If beans won't do what else can be recommended.—A. S., Santa Rosa.

If you are not prepared to irrigate your vineyard, it will be very bad policy for you to grow anything between the vines. If you think you will have room enough cultivate and irrigate. Large White, Black Eye and the Pink beans are the best varieties for your section.

If any crop is raised between your vines, there is none better than a bean crop.—J. W. M.

Bulletins Wanted.

Will you kindly inform me through columns of the Cultivator to whom I should apply for Bulletins on Dry Farming, practiced in the states of Utah, Kansas and Nebraska; also for Forest Service Bulletin, 72, and oblige. —H. L. D., Stockton.

For Forestry, send to Forest Service, Department of Agricultural, Washington, D. C.

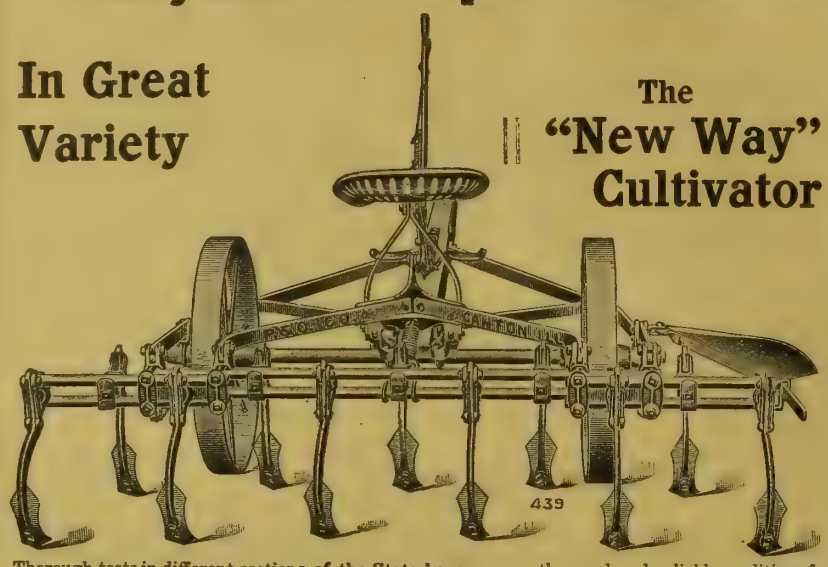
For others: Directors of Agricultural Experiment Station—Manhattan, Kansas; Lincoln, Nebraska; Logan, Utah; Fort Collins, Colorado.

We believe the last named has issued an excellent bulletin, but we have mislaid our office copy.

Orchard and Vineyard **Implements**

In Great Variety

The "New Way" Cultivator



Thorough tests in different sections of the State have proven the good and reliable qualities of this tool. There is great clearance space between front and rear rows of shovels. It is raised and lowered with the utmost ease and both rows of shovels are on the same level at all depths.

General Agriculture

CALIFORNIA'S CEREAL WEALTH.

FORTY-EIGHT counties of California have sent in statistical reports to the State Agricultural Society for the year 1906, as required by law. These show a total cereal acreage, and yield and value as follow:

Wheat, 1,458,284 acres yield 720,023 tons, or 24,000,767 bushels, valued at $13,289,904; barley, 1,750,756 acres, yield 849,490 tons, or 33,979,600 bushels, valued at $16,987,575; oats, 314,507 acres, yield 131,126 tons, valued at $3,331,980; corn, 71,879 acres, yield 65,106 tons, valued at $1,532,520; rye, 21,158 acres, yeild 6,629 tons, valued at $286,255; buckwheat, 400 acres, yield 300 tons, valued at $7,500.

This gives a total grain acreage of 3,616,984, a total yield of 1,772,674 tons, of a total value of $35,425,734.

The Hay Crop.

The same forty-eight counties give the hay crop for 1906 as follows:

Alfalfa hay, 338,788 acres, yield 1,400,822 tons, valued at $8,713,903; grain hay, 1,822,380 acres, yield 2,636,979 tons, valued at $21,628,294; grass hay, 54,633 acres, yield 75,376 tons, valued at $570,230.

These give a total hay acreage of 2,215,801, a total yield of 4,113,177 tons, of a total value of $30,912,427.

These figures show the total value of hay and grain to be 66,338,161, and it will be noticed, as was the case in 1905, the value of the hay crop acre for acre is considerably more than the value of the grain crop. In other words while the grain crop shows an average return of $9.80 an acre, the hay crop shows an average return of $13.95 an acre. It is the greater yield and value of alfalfa which enlarges this difference, and yet not altogether, as it will be noticed that the average value per acre of grain hay is $10.80, which is $2 an acre more than the average value of grain. It is often a problem with the farmer whether to cut certain foul grain for hay or not. The showing here would seem to be in favor of cutting everything for hay that will not make good, clean grain.

Total Acreage.

As we have said, the figures heretofore given are computed from the returns from forty-eight counties. This leaves nine counties that have not reported. There are fifty-seven counties in California all told, and as nine is less than one-sixth of fifty-seven, it would be conservative to add one-sixth to the fore-going figures to arrive at an estimate for the entire State. On this basis we find the total grain acreage of the State to be 4,219,808, the total yield to be 2,068,113 tons, and the total value $41,330,023. The total hay acreage on the same basis would be 2,585,101, the total hay yield 4,798,705 tons, and the total value $36,014,498. These figures give a grand total acreage of hay and grain for 1906 in California of 6,794,909, a total yield of 6,866,818 tons, of a total value of $77,344,521.

The total figures for 1905 were $77,232,595, showing only $111,926 difference in the aggregate value of the cereal crops of the State for the two years, the slight difference being in favor of 1906.

It is worth something to know the acreage and value of the products under consideration, and the foregoing figures, returned to us in two successive years, are given as the best estimate that can be made from the resources indicated.

Beans and Potatoes.

Returns from the same forty-eight counties, with one-sixth added as an estimate for the products of the nine counties that failed to make returns, show the total bean crop of California for 1906 to be 256,751,714 pounds, valued at $8,060,948; for the same year the total crop of Irish potatoes was 355,794,507 pounds, valued at $3,772,446, and the total crop of sweet potatoes was 34,351,835 pounds, valued at $4,171,139.

The total value of all potatoes and beans is $12,250,532. This amount added to the value of cereals gives a total of $89,595,053 as the total of California's leading agricultural staples (exclusive of products of the tree, vine, and garden,) for 1906.

"I don't know why, but I always feel as if young Softed ought to have a 'To Let' sign hanging on him."

"Perhaps it is because he always has such a vacant air about him."

CORN CORN CORN CORN

Plant Eastern-Grown Seed Corn

Johnson & Musser Seed Co.

Up-to-Date Seed House

Iowa Silver Mine, Grown on the Rosemead Ranch by James Gooch from our Eastern-grown Seed.

We have just received our usual carload of Nebraska-grown hand-picked Seed Corn, and offer it at the following prices f.o.b. Los Angeles:

King of the Earliest, 85 days. The earliest Dent variety. Ears short, 12 to 16 rows, well filled. Grain long and yellow, making an extra quality meal. Per lb. 5c; 100 lbs. $3.50.

Improved Leaming, 90 Days. Ears are large and handsome, with deep, large grains; orange-yellow color and red cob. Per lb. 5c; 100 lbs. $3.50.

Pride of the North, 90 Days. One of the best sorts; ears have from 14 to 16 rows 8 to 10 inches in length, slightly tapering; color light orange. Per lb. 5c; 100 lbs. $3.50.

Minnesota King, 100 Days. A large-grained variety; yellow. Per lb. 5c; 100 lbs. $3.50.

Wisconsin White Dent, 90 Days. A perfect white Dent corn, of good quality, resembling the Leaming. Per lb. 5c; 100 lbs. $3.50.

Champion White Pearl, 90 Days. A fine white flint corn. Per. lb. 5c; 100 lbs. $3.50.

Early Mastedon. Having grown and sold the Early Mastedon corn four years, we recommend it as being decidedly the best of all Yellow Dent varieties. Every one who has seen it grow is enthusiastic in its praise. Large ears, deep grains, and as many as 24 rows on a cob. Eastern grown, per 100 lbs.$3.50.

The Iowa Silver Mine. A large White Dent. The grains are as large as the Hickory King, but longer, having a small cob. It is the most desirable of all White Dent varieties. Per 100 lbs. $3.50.

Red Cob, Ensilage. A large stalk with a profusion of leaves which makes it the most desirable for ensilage. Price, per 100 lbs. $3.50.

Stanford White Flint. An excellent White Flint corn. More prolific than the King Philip. It is an excellent extra early table corn. It has long ears and a small cob. Price, per lb. 5c; per 100 lbs. $3.50.

White Cap Yellow Dent. Exceedingly prolific and hardy, resisting drought much better than other varieties. Per 100 lbs. $3.50.

Reid's Yellow Dent. This is the variety that has been brought to a high state of perfection by the Illinois growers, and drew the medal at St. Louis because it averaged the greater number of pounds per bushel. Price, per 100 lbs. $3.50.

Kink Philip, 90 Days. A small yellow variety, very popular in this market. Price on application.

Hickory King, 110 Days. A white variety, having the largest grain with the smallest cob ever introduced in a white corn. Price on application.

Johnson & Musser Seed Co. **115 N. Main St., Los Angeles**

CROP ROTATION.

While the good results following a well considered crop rotation have long been known, the South Dakota Experiment Station has made a series of tests during the past eight years that have brought out its importance in the maintenance of soil fertility that will surprise most farmers.

During the eight years referred to twenty-three rotations were carried out at the station, and wheat was grown in each one. It was found that the best average yield of wheat was obtained where the crop followed either corn or potatoes. Following these crops in the order of their merit as preparation for the growth of wheat, come summer fallow, millet, vetch, peas, wheat and oats.

According to the results obtained, the dryer the season or the more unfavorable the conditions for the production of the maximum crop of straw and grain, the more important becomes the introduction of a cultivated crop in the rotation. Wheat being a more particular crop than oats it should have a better place in the rotation than should the latter crop.

Flax is not more exhaustive of the fertility of the soil than are the other grain crops.

The growth of nitrogen-gathering crops as represented by Canada field peas and by vetch has increased the growth of straw in the following crops without materially increasing the yield of grain. This has been the most marked where peas have been plowed under as green manure or "hogged down" on the land.

Plowing under peas for green manure has not yet shown any benefits over a summer fallow.

At the end of eight years land that has grown wheat and corn alternately is producing better crops of wheat, of both straw and grain, than is similar land upon which wheat has been alternated with vetch and with summer fallow.

It has not on our soil proved profitable as yet to manure land that grows wheat alone.

POTATO SPRAYING.

The fourth year of the ten-year series of potato spraying experiments begun in 1902 is now completed.

At Genevea Experiment Station five sprayings increased the yield 119 1-3 bushels per acre, while three sprayings increased at 107 bushels.

The gain was due partly to prevention of late blight and partly to prevention of rot. At Riverhead, the gain due to five sprayings was 82 bushels per acre and to three sprayings, 31 1-3 bushels. Here, the flea beetle was the chief enemy.

In thirteen experiments, including 166 2-3 acres, the average gain due to spraying was 46 1-2 bushels per acre; the average total cost of spraying, $4.25 per acre; the average cost of each spraying, 98 cents per acre; and the average net profit, $20.04 per acre.

In fifty experiments, including 407 acres, the average gain due to spraying was 59 1-2 bushels per acre. In these experiments the average total cost of spraying was $4.75 per acre; the average cost for each spraying, 92 cents; and the average net profit, $29.85 per acre.

Potatoes are in no way injured by Paris green properly applied: viz: in moderate amount (one to two pounds per acre) with Bordeaux mixture.

In unsprayed fields the loss from blights, rot and flea beetles was at least 50 bushels per acre on the average. Most of this loss was due to late blight and the rot which follows it.

The general tendency of spraying is to reduce the amount of rot. In most cases the reduction is very marked; in some cases there is no difference; and occasionally spraying increases the amount of rot. It depends on weather conditions and the thoroughness of spraying. But whatever the effect on rot, sprayed plants always give a larger yield of marketable tubers.

Judging from the experiments thus far made it appears that spraying for blight is an operation which no potato grower in New York can afford to neglect. Thirty-three farmers' experiments made during the past three years show an average net profit of $22.79 per acre due to spraying.

Commence spraying with Bordeaux when the plants are six to eight inches high and repeat at intervals of 10 to 14 days throughout the season, making, in all, five or six applications. When bugs are troublesome add some Paris green or other poison.—From Bulletin No. 279 of the New York Experiment Station.

GROWTH OF AGRICULTURE.

One of the most significant signs of the times is the rise of the agricultural industries into commanding position and the awakening of a general interest in rural subjects. Everyone seems to be aware that agriculture is making great progress. Now, all progress in the arts and industries rests on knowledge and the imparting of knowledge; in this case, it rests very largely on the activities of experiments stations and colleges. The work of these institutions, accumulating slowly and methodically, has leavened the lump. If there is an agricultural problem these institutions are to make the heaviest contribution toward solving it.

With all the awakened interest and the exploiting of individual instances, the townsman is not yet aware of the tremendous rise in the tone and efficiency of the entire agricultural industry, which may well be likened to the gradual elevation of a geological stratum of continental extent. At the same time, the agricultural population is retaining its old-time vigor, independence, and native philosophy. The student who enters this field will most assuredly not succeed unless he has good talents and efficient training and properly estimates the problem, but it is nevertheless perfectly evident not only that an educated man can succeed in agricultural arts but that in time this type of man will be the only one who can hope for the best results.—Prof. L. H. Bailey.

PLOWING.

Whenever an annual plowing will leave the surface bed in better condition to conserve water in the root layer, it has a value in addition to the better aeration which it secures. As to shallow or deep plowing that should be determined by the depth of the pulverized bed necessary for best conservation of moisture below, which varies in different soils. It is a mistake to disturb the roots below that point.

HONEY IN EUROPE.

Vice Consul Charles Karminski, of Seville, furnishes recently published statistics in relation to Europe's production of honey, which designates Spain as second in the supply of that product, the total number of her beehives being 1,090,000 and the quota of honey furnished by her nineteen thousand tons out to eighty thousand, the world's yield. Germany with two billion beehives, produced twenty thousand tons of honey, a larger quantity than all other countries, Austria, ranking third, produced eighteen thousand tons of honey, France ten thousand, Holland and Belgium less than two thousand five hundred [illegible], Russia and Denmark one thousand tons each.

"The head of the firm," said the superintendent, "insists upon our employing his son in this department and it's as much as we can do to keep him idle."

"Idle! You mean busy, don't you?"

"No, I don't! If we kept him busy it would keep three or four other men busy correcting his mistakes."—

The Produce Markets

Los Angeles Markets

LOS ANGELES, Mar. 13, 1907.

Clear weather yesterday brought in a heavy supply of butter, cheese and eggs, as shown by the receipts posted on the board of the Los Angeles Produce Exchange this morning. The increased supply of these commodities did not affect the market sufficiently to change prices.

Butter has been so scarce during the last two days that large receipts could in no way weaken the butter market, for dealers who have been forced to go without butter during the shortage took all they could get to fill back orders.

Heifers 4½
Calves, per lb 5
Sheep, ewes, per head 5.50
Lambs, per head 4.00
Wethers 5.50

Potatoes

Potatoes are again piling up. Receipts yesterday were over twenty-one cars which makes for the last two days thirty-four cars. This is about fourteen cars more than the estimated amount needed to meet consumption.

There were only a few potato dealers active in the market this morning, and consequently trading was slow, but it is hardly thought this was an indication of weakness or that there will be any declines as a result of today's heavy shipment, although a few more days with as heavy arrivals will in all probability set prices back to their low standing of about a week ago.

Hay

Hay arrivals for last week amounted to 2644 tons.

This shows very much lighter receipts than we have had for some time. The railroad companies are doing very little for the market. There is an embargo placed on shipments to San Francisco, and this coupled with the fact that Hay tributary to the water is about cleaned up, makes the situation an extremely serious one.

We are apparently in the hands of the railroad companies, as we have been all season, but it seems to be impossible to make any change in the situation. Shippers in every direction are clamoring for transportation. Every possible influence has been brought to bear upon the railroads, but without avail.

Under these conditions our market continues exceedingly strong and prices have advanced a trifle. There is practically no choice as to grade or quality, all kinds of Hay being picked up as rapidly as they come in.

Alfalfa alone shows signs of weakness, there being an abundant supply of that by reason of the fact that the demand has greatly diminished.

Straw is scarce and sells at high figures. This is because all available transportation is used for Hay and cannot be taken for Straw.

OUR OWN FOUR WALLS.

The storm and night are on the waste,
Wild through the wind the herdsman calls,
As fast on willing nag I haste
Home to my own four walls.

Black, tossing clouds, with scarce a glimmer,
Envelope earth like sevenfold palls;
But wifekin watches, coffee pot doth simmer
Home in my own four walls.

A home and wife I too have got,
A hearth to blaze whate'er befalls;
What needs a man that I have not
Within my own four walls.

King George has palaces of pride,
And armed grooms must ward those halls;
With one stout bolt I safe abide,
Within my own four walls.

Not all his men may sever this;
It yields to friends,' not monarchs,' calls;
My whinstone house my castle is,
I have my own four walls.

When fools or knaves do make a rout
With gigmen, dinners, balls, cabals.
I turn my back and shut them out—
These are my own four walls.

The moorland house, though rude it be,
May stand the brunt when prouder falls;
'Twill screen my wife, my books and me
All in my own four walls.

—Thos. Carlyle.

WON BY A NOSE.

DR CARLING reached into the drawer and drew out a large envelope.

The action reminded him of a pamphlet he had promised Darnton, so he took out another envelope and slipped into it the brochure on scarless surgery which was attracting so much comment.

Then the telephone bell rang, and he picked up the receiver to answer the call before addressing the envelopes.

Being a busy practitioner, the incident was not brought to mind again until he encountered Darnton coming down the hospital steps the next morning.

"I received your book, doctor," the latter chuckled. "Something of a departure, isn't it?"

"It's a reprint from my paper in the Journal of Surgery," he answered carelessly. "You asked for one the other day, you will remember."

Darnton drew it from his pocket. "I think you made a mistake," he smiled, as he handed it to the other man.

Carling glanced at the title and gasped. This little volume was a paper-bound copy of some poetry concerning which Miss Sarah Longwood had asked.

He had sent it with a little note saying that he hoped that the little volume would interest her. He had put the letter in the wrong envelope, and it had gone to her along with his brochure.

In this he had specially marked the report of a case in which he had reduced a hook nose to a respectable Roman outline without leaving a scar.

It was the case in which Darnton had expressed interest, and to send it to Miss Longwood of all persons; she who was the aunt and guardian of the girl he loved, and the possessor of a nose of gigantic proportions!

That settled his chances with Nettie. Probably she would be as angry as her aunt, and neither could be convinced that the whole thing was not a studied insult.

There was only one thing to be done. He must at least offer an apology. It was late in the afternoon before his rounds were finished and he could call at the Longwoods'.

With a nervous perspiration beading his face, he rang the bell and faced the butler.

"Miss Nettie is not at home," the servant said pompously, and Carling's heart sank. She would not even see him, and he must trust to the cold and formal written explanation.

"Miss Longwood is at home and desired to be informed if you called," went on the butler. Carling started. He had hoped to make Nettie his intermediary.

"Ask Miss Longwood if she will see me," he said, as he passed into the reception-room.

The butler returned to say that she would be down immediately, and Carling fidgeted through five dreary minutes, every sixty seconds of which seemed an hour.

At last she entered, tall, imposing and severe. Carling sprang to his feet.

"Nettie is out, doctor," she said in greeting. "But I wanted to see you a moment about that book. It was very thoughtful of you."

Carling stared. Was there some chance that a second blunder had been made somehow? Miss Longwood motioned him to a seat and took a chair near him.

"A great many persons would have lacked the courage to send it," she said. "It shows your thoughtfulness that you took the chance of giving offense. How did you know that I was not proud of the Longwood nose?"

"I thought—" he stammered. He could not complete the sentence and explain that he thought he was sending some poems.

"I am sorry that you did not speak of it before," she went on. "I know that it is ridiculous for an old woman like me to care whether her nose is pretty or not, but ever since I was a child I have hated it. I did not know that an operation could be performed with the certainty that there would be no scar."

"It is a new treatment," he explained: "A matter of dressing. I have had a number of similar cases since that paper was written, but—" He wanted to disclaim credit, but the old lady would not have it.

"Don't say 'but,'" she ordered sharply. "I want you to arrange to reduce my disfigurement just as soon as you can, and I cannot tell you how grateful I am to you."

Carling walked from the room like a man in a daze. It was a simple enough matter to perform the operation, and when the wound was healed it was a very different Miss Longwood who presided at the wedding of her niece.

"That's all over," said the new Mrs. Carling, as the carriage rolled away from the house. "For a time I was afraid there was no hope. Auntie was determined that I should marry Bob Storms, but your lucky suggestion

about surgery carried the day. However did you come to think of sending her that article?"

"I didn't," he explained. "It was all a mistake."

"Don't ever tell her," pleaded Nettie. "Let her keep thinking that"—

"I won—by a nose," laughed her husband.—Irving Boice.

ORANGE MARMALADE.

I am trying to study up a plan to turn oranges and other products of the ranch into money and to this end I have been experimenting with orange marmalade, until I am able to produce an article of fine quality in experimental quantities.

I am trying to find out if such products put up in glass and of such quality that they will stand any test for purity, can be prepared and sold and if a financial success can be made of the enterprise and to this end may I trouble you to answer these inquiries:

1. What per cent. of profit between the actual cost of the product and the wholesale selling price is required to make a financial success?

2. Can the small producer survive the competition of the larger and well established concerns?

3. Can a success be made of sticking to one line, such as orange marmalade, or is there an advantage in having a diversity of products?

4. Do you think there is a good demand for orange marmalade?

5. Is the best market for such goods on the Pacific Coast and will the freight rates East, whether in carload lots or in small quantities, eat up the profit of shipping East?—G. C. R., Tustin.

Orange marmalade has to be made in small lots, that is each individual lot is small in quantity. The amount in each container is limited to a small lot. A couple of hundred eight quart granite-ware pans will not hold a large quantity as jam making goes, for it has to remain in the pans and they are not ready the second day to go into use. With other fruits, the large copper steam cookers can be used and the matter pushed along rapidly. Cane sugar is necessary if a commercial article is to be produced as the transportation companies and the commission men contract all calls for it.

The next thing is to test your make by the market standard. To do this, buy a number of the best makes and take small plain water tumblers, put the jam into them, numbering the jars, and put a sample of your own jam among the number. Invite in a number of friends, men and women, and give them plain crackers, and have each one sample the glasses of jam and write down the number of the best. This may seem to you foolishness, but it is the best way to reach a decision as to the popular taste. One may make an article vastly superior to the commercial article and find no sale, for people are set in their tastes. After you have found out what you are at in the making, then try and see if you have it down fine enough to make a uniform article, for if you slip up the least it will be to sacrifice the trade already gained. Seal up carefully a jar out of the batch and keep it in sight to work to as a sample in color, texture and flavor.

1st. The large canneries of the state count that if they make ten cents on a case on a pack of a hundred thousand that it is profitable.

In a small way, I have asked several old canners, they tell me you should have 25 per cent. for yourself, jobber 20 per cent, and retailer 20 per cent. You see this runs up to 65 per cent. above cost.

2nd. Yes, if in a settled community and he is satisfied with a limited business. Madame Crichnor of San Francisco made a comfortable living for herself and family for years in selling jams. The only jam she made that was equal to the domestic manufacture was the orange.

3rd. I should begin with one product and when it was a good seller add others to it, making quality stand for more than quantity.

4th. I never had difficulty in disposing of all I made right in Fresno, and surrounding villages. The manufacturer must create the demand by advertising. I always aimed to put up a number of small sample jars with the exact label of the other larger jars, and then send a man or girl around to the consumer. In a small place take two or three houses in a block and give samples. The women will tell each other. After a week follow around to these houses with a supply in the buggy and sell as much as you can. Take the names and addresses of each customer. When you have a reasonable number of customers go to the grocers and ask them to take the articles, showing them the list of consumers, and agreeing to carry so much advertisement in the local paper of the jam.

5th. I should be very slow at trying to reach a trade in the east, for if the matter is not a large one the commission men in the east do not take a great interest. You are far away and at first are likely to be fleeced by unprincipled men there. It is easy for them to refuse a shipment on some little clause or fault, they then offer to arbitrate and you at a distance are naturally less important to the arbitrators than the friendship of the men who are rejecting the fruit. You stand to lose nearly every time. While the matter is being arbitrated, if the price suddenly goes up, above the price the goods are purchased for, the wires are hot with apologies and the goods are accepted at once. It would take good business energy and a large sum of money to create demands for carloads of orange marmalade. The secret of success is in pushing hard and backing it up with a good keeping article.—M. E. S.

TYPES OF FARM ANIMALS.

Charles S. Plumb, professor of animal husbandry in the college of agricultural of the Ohio state university, has issued a most valuable work on types and breeds of farm animals, which supplies the need for an up-to-date discussion of the several types and breeds of horses, asses, mules, cattle, sheep, goats, and swine. This volume describes the commonly accepted types, as for example, draft or speed type of horse, dairy type of cattle, and bacon type of swine. It includes discussions of the original habitat, of breed development, European history, special American history, work of pioneer breeders, famous animals, families or tribes, breed characteristics, breed and individual records, as, for example, milk of cows, butter, or speed of horses, etc. Many noteworthy records are given and numerous illustrations of famous animals shown. A comprehensive table of contents and an index form an important part of the book.

The work is primarily intended for students in agricultural colleges and universities. Breeders and feeders of animals, however, will find this volume a valuable reference work.

WILL NOT STRIP THE BRANCHES

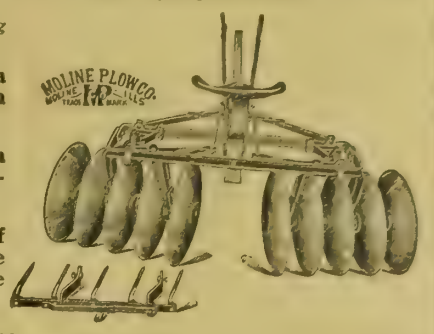
The Moline Reversible Disc Harrow is an ideal tool for orchard cultivation. The frame is built down close to the discs making it lower than any other harrow of its class; the levers are short and always in the center, making it practical to work under low hanging limbs without stripping the branches.

The harrow is all steel and iron excepting the pole.

The discs may be reversed in a moment without taking them from under the frame.

The gangs may be tilted by a simple adjustment of the malleable frame spreader.

Bearings have a double set of wood blocks, giving twice the wearing surface to meet the end thrust.



For Orchard Work the Moline Reversible is equipped with an extra long frame instead of extension head.

The correct design, great durability, ease of handling, low build, arrangement of levers and adjustment for setting the gangs in and out on the frame makes this an all around harrow. Protected by patent. Made in four and five foot, 16, 18 and 20-inch discs; four and five foot, 16 and 18-inch cut out discs.

Before buying a Reversible Harrow ask your dealer to show you the MOLINE.

Send Us Your Name and Address, enclose four cents in stamps to pay postage and mailing, and we will send you our **FLYING DUTCHMAN SONG BOOK** and Junior Catalogue Combined, containing Twenty-six old Familiar Songs with words and music.

Bees and Their Care

VALUE OF HONEY.

Some fear the honey they will buy may be adulterated; others think honey is not good food—"it is too heating," or some other dictum. There are signs, however, that honey will soon come into its own again, and rank at the top of the foods adapted by nature to the use of mankind.

Among physiologists honey is regarded as a predigested food the same as milk and eggs. Not many persons are aware of this. But bees really prepare honey—they do not gather it. Bees consume the nectar of flowers and produce therefrom a food for themselves and their young, which we call honey. It is really, then, predigested, requiring no further preparation to make it a perfect food. This explains why it was so popular with the ancient doctors. We now know that careful attention to diet and good hygiene form more than half the battle in nursing the sick. Honey also possesses a medicinal value probably due to the presence of minute quantities of the essence of flowers. Therefore the value of honey in medicine depends on the source of the nectar from which it was made. Basswood honey is supposed by many to be good for those suffering from consumption. Onion honey is said to be useful in colds. But this as it may, we are absolutely sure honey is a very fine food, and where there is a craving for sweets in children honey forms undoubtedly the best means of satisfying this natural longing. Honey is supposed to be fattening, but it is different from sugar in this respect, for sugar when injected into the human stomach has to undergo a process of 'inversion," whereas honey goes on to the intestines without further elaboration. This explains why a person suffering from diabetes must abstain from eating sugar, and yet may eat honey with impunity.

Some are afraid to buy honey, fearing they will get something which has been adulterated. Whatever may have been the case formerly, this is not the case now, though there is still some adulteration practiced, particularly in states without pure-food laws.

Honey in the comb is always pure and if one likes this kind of honey, it is perfectly easy to be always certain that it is absolutely pure. Our modern scientists are very able and clever, but none has been able to imitate even approximately the exquisite handiwork of the bees and we are sure they never will.

BAD BEE MANAGEMENT.

A large part of Farm and Ranch readers keep bees and a large part of its readers have let the bees take care of themselves. The latter class should get out of the old box gums, get the movable frame hive and transfer their bees and improve their stock and begin to derive some revenue from them. Sometime ago I was on the market square here in Waco, selling honey, and a certain farmer was there every morning with his fruit and melons, and seeing the writer there every morning with honey, came up and said: "Phillips, I want to know how you always have honey to sell and I, with forty gums of bees, can't get enough honey for my family to eat?" I said: "What kind of hives have you?" He said: "Just a square gum." I said: "Well, do you pay any attention to them?" and he answered: "No I hive them and let them go." Then I said: "Well, suppose you would do your melons and orchards that way, how many peaches or melons would you bring to market?" "None." Just so with bees.

The above illustrates the way that many farmers keep bees, and Farm and Ranch reaches a very large class of these. The farmer's wife could take charge of the bees and devote a little study to them and have a few bees and get practical knowledge, and would soon find that her bees would bring her more money than her chickens with less labor and a great deal more pleasure. Of course, you must understand how to manage them and study your honey plants to know just when they will come into bloom, so as to have the bees built up to strong colonies and keep them from swarming. The writer had only one swarm this year out of twenty-five colonies, and we had them in ten-frame hives, and two and three stories high. Such colonies always gather lots of surplus honey.—Farm and Ranch.

"Ever try an automobile, Judge?" said a friend. "No," replied the Judge "but I've tried a lot of people who have."

TWO PIANOS! CASH! BIG PRIZES FREE!

If this chart gets destroyed another printed upon heavy paper will be sent upon receipt of 2c stamp for postage.

CAN YOU COUNT THESE DOTS?
SUCESSFUL FARMING WILL GIVE TO THOSE WHO CAN COUNT THE DOTS IN THE PIANO CORRECTLY OR NEAREST CORRECTLY, THE FOLLOWING LIST OF PRIZES: CAN YOU DO IT?

Two Elegant Pianos, one to a lady and one to a gentleman.
2nd. Two Hundred Dollars Cash.
3rd. One Hundred Dollars Cash.
4th. Fifty Dollars Cash.
5th. Twenty-five Dollars Cash.
Next 5. Ten Dollars Each.
Next 10. Five Dollars Each.
Next 25. Two Dollars Each.

CONDITIONS: 50 cents pays for one year and one count. $1.00 pays for two years and three counts. You get $50 extra if you have three counts. It will pay you to have three. See conditions below.

DON'T DELAY!
IF YOU WANT A PIANO OR OTHER PRIZES FREE SEND YOUR COUNTS AT ONCE

PRIZE WINNERS IN PAST CONTESTS

A Piano for $1.00. Surely people may enter your contests knowing that they will receive fair treatment. How glad I was to win a piano for so small an amount and wholly unexpected. The paper alone is worth all I paid.
MRS. L. W. NOTT, Marion, Ia.

He Won a Piano. Refer people to me if they want to know whether you are honest. I got a piano for a prize and never heard of you until I answered your ad. Your paper is worth twice the subscription price. W. C. ELLIOTT, Audubon, Iowa.

$100.00 Prize. I got my $100 and it was the easiest I ever earned. The dots are hard to count but I know the prizes go to those who win them fairly.
AMY R. BARNES, Van Horn, Iowa.

Won $350 Cash. To Whom It May Concern: I won grand prize of $350 Cash in last contest. I was much surprised. I want to vouch as to Successful Farming's fairness to any and everybody. JOHN A. GOODWIN, Richmond, Va.

$50.00 for Canada. Way up here in Canada I won $50. I never knew there was such a paper until I answered ad, now I will never be without it again.
MISS E. FORNIER, Mantane, Quebec

Won a Piano. I received the elegant piano which I won in your recent contest, and all was perfectly grand. I am recommending you to all my friends and you are at liberty to use my name as reference any time you wish.
ISAAC SHOTWELL, Rockland, Ohio.

A PIANO

MRS. L. W. NOTT, Marion, Iowa.

A PIANO

W. C. ELLIOTT, Audubon, Ia.

$50.00 CASH

EUGENIE FOURNIER, Matane, Quebec.

OTHERS WHO HAVE WON:

Pianos—Myra A. Fursman, Panola, Ill. E. L. Jones, 82 Cottage Ave., Ansonia, Conn. Mr. Libbie Greulick, St. Paul. Minn. W. S. Keever, 817 Freeman St., Cincinnati, O. J. Gemachlich, Kensington, Kan. Edith Hutchinson, Leonard. North Dakota.

$100 Eva I. Buckner, Fredonia, Kas. C. S. Wyman, Vinton, Iowa. E. M. Hall, Montrose, Mo. J. W. Smith, Rome, Okla.

$50 S. Irving Steyer, 225 E. Balt. Baltimore, Md. L. F. Stinson, Arcata, Calif. A. J. Perdue, Altoona, Ia. Albert Peterson, Holdrege, Neb. Chas. McBride, Peoria, Ill. Jos. Unser, Belleview, O. Mrs. D. H. Stoner, Granger, Ia.

THESE ARE BUT A FEW OF MANY. WE COULD GIVE A LIST OF HUNDREDS IF WE HAD SPACE. YOU MIGHT AS WELL BE A WINNER IF YOU GO AT IT AT ONCE.

CONDITIONS—50 cents pays for a year's subscription to SUCCESSFUL FARMING and one count; $1.00 pays for two years and three counts and makes you eligible for the special $50.00 prizes given to winners of 1st prizes if they have three counts. See below.

AWARDS will be made as follows—The person giving correct or nearest correct count will get first prize. Next nearest second, etc.

$50 PRIZES—We believe everybody should have three counts so they can have one each side of what they think is correct to be more sure to hit it. To encourage this we will give $50.00 extra to winners of 1st prizes if they have three counts. Remember if you have one count you get piano only, but if you have three counts you get $50 extra.

TIME PRIZES—$25.00 Extra. We feel early counters should be rewarded and we will give $25.00 to the person sending best answers by Feb. 28th.

OUR RESPONSIBILITY—We are a responsible business house, and every prize must be and will be paid as stated. We refer to Iowa National Bank, Central State Bank, German Savings Bank; in fact any Bank, Express Company, business house or individual in Des Moines, as well as Dun or Bradstreets Agency, or the publisher of this paper.

JUDGES—We have wholly disinterested judges to award prizes. Here is what they say:

TO WHOM IT MAY CONCERN: We have been asked by the publishers of SUCCESSFUL FARMING to act as judges in their contest and see that prizes are all awarded fairly. This we will gladly do guaranteeing each contestant absolute fair treatment. Signed—W. W. MORROW, Treasurer State of Iowa; HUGH BRENNAN, Judge District Court; Rev. A. J. WILLIAMS.

In case of tie we will write each person so tied asking them to make as few words as possible from the letters of the alphabet, using each letter of the alphabet twice and only twice, and no one word more than once, each letter left over counting as one word. To the one tied in the counting who gives us the fewest words as above will be awarded first prize. This practically eliminates all question of tie, but if there should by any possibility be a tie in this the prize will be divided equally between those so tieing.

Subscription without counts is 25 cents per year, additional counts after you have three entered as per our terms in paragraph "condition" above may be entered at 25 cents each.

This contest is not to be confused with the guessing or estimating contests. Our contest is a test of skill in planning and counting and the best man wins. Nobody connected with our paper will be allowed to compete. Contest closes June 30, but get your counts in at once. See about time prize above.

Publisher SUCCESSFUL FARMING, 278 Tenth St., Des Moines, Iowa.

I enclose $..... for subscription to SUCCESSFUL FARMING, and I wish to enter the.....(write ladies' or gents') Contest. If $1.00 is paid send three counts; if only 50c is paid send ONLY ONE count. The extra $50.00 go only to those having THREE or more counts entered.

My Count is: (1).....(2).....(3).....

HOW TO FERTILIZE.

Every farmer knows that plants ed Food as much as cattle. He nows, too, that plants cannot get l the Food they need out of the ound alone. He must supply them ith certain Foods himself, or they ill not thrive and bear their full yield fruit. Exactly as he supplys hay id oats to his horse so he must sup- y Nitrogen and Phosphate to his ants. He may buy these in the open arket exactly as he does his hay or s oats, or he can buy them in com- nation in the form of a "complete rtilizer." There is no secret value the complete fertilizer, it is noth- g more nor less than the ingredients mbined and sold at a higher price. itrogen is by far the most expensive s well as effective of plant foods, and will pay the farmer well to stop id think before he buys it in this mbination form.

The Best and Cheapest Ammoniate.

The cheapest and most practical rm in which to furnish Nitrogen to lants is Nitrate of Soda. In the rain- ss region of Chili are stored away ast quantities of Nitrogen in what e known as Nitrates—the only form i which Nitrogen can be utilized by plant. The Nitrogen which exists organic matter, that is, roots, ems, dead leaves, weeds, leather, ied blood, etc., and also Nitrogen in ie form of Ammonia salts, must first e changed to Nitrate before it can e taken up by plants. This change dependent upon conditions of weath- . If season is backward or there e a prolonged drouth this change ay be so retarded as to deprive the lant together of Nitrate Food at the ery time it needs it most; moreover itrogen in the form of Ammonia salts aves acid residues in the soil. Ni- ate of Soda, on the other hand, is ntirely independent of weather and aves the alkali behind as a soil weetener. It is immediately avail- ble under all circumstances, for it is eadily soluble, and immediately it omes within reach of the roots of lants it begins to be taken up by them. t can, therefore, readily be seen that he practical value of various forms f Nitrogen ranges from nothing at all, here conditions of temperature or oil prevent. Nitration, to 100 per ent. as Nitrate of Soda where Ni- ration has already completely taken lace. Moreover, the process of trans- orming the Nitrogen of cotton seed neal, dried fish, dried blood, tankage, nd other nitrogenous constituents of complete fertilizers," etc., into Ni- rate is very wasteful, for much val- uable Nitrogen is lost in the process, as well as by natural oxidation. Soil experiments have shown that 100 pounds of Nitrogen in these organic forms have only about one-half to three-fourths the natural value of 100 nost of their Nitrogen during the early pounds of Nitrogen in its Nitrated form of Nitrate of Soda.

A Great Saving.

In view of these facts it seems ex- traordinary that farmers, should con- tinue to purchase their Nitrogen in compound form with phosphate, when they can procure it much cheaper, and ready for the plants' immediate use, in the form of Nitrate of Soda. The New Jersey Experiment Station, after ana- lyzing nearly 200 different "complete fertilizers," found the average value or market price of the various constit- uents to be $25.66 per ton, while the average selling price was $34.23 per ton. In some instances the actual value of the plant food was as low as $15.00 per ton, while the price per ton was $35.00. Available Nitro- gen in the form of Nitrate of Soda costs about 17 cents per pound. It costs from 25 to 30 cents a pound in so-called "complete fertilizers," and even then it is often in a form which is not available as food for the plants, for it must first be converted into Ni- trate. The time required to do this varies from a few days to a few years according to the temperature of the soil and the kind and condition of the material used in the "complete fertilizers."

It must be recognized that the farm- er should have a chance to derive some profit from the use of a fertil- izer, and wise buying is a prerequisite to successful use.

How it Helps Crops.

If a young pig or a young calf does not have an abundance of the right kind of feed when it is young never recovers from it, no matter how judiciously it is afterwards fed. The in- telligent cultivator has learned that this holds good in the feeding of plants. Nitrogen is the element which enters most largely into the building up of the plant itself—root, stem and leaves. Most plants need to take up most of their Nitrogen during the early stages of their growth, as in oats. It is plain, therefore, that the cultivator cannot afford to overlook Nitrate, and thus endanger the chances of his crops which must have Nitrogen in a form the plants can use. The presence of Nitrate at the outset enables the plant to get its food when it needs it most and develops a vigorous growth of roots, leaves and stems capable of withstanding the scorching rays of the sun or sudden changes of the tem- perature, disease, or the attacks of parasites.

Nitrate of Soda is of high value for early crops, such as peas, corn, beets, cabbage, etc., where rapid maturity is desirable. It is a special help to hay, grain, rye, wheat, timothy, or- chard or other cereals or grasses, all of which are unable to obtain suf- ficient Nitrogen from the soil just when they need it. It is a great spe- cific in the production of sugar beets, potatoes, cotton and cane.

Small fruits, such as blackberries, currants, raspberries and gooseberries, which need a steady, even growth, are greatly benefited by Nitrate of Soda, which can be furnished all ready for digestion when the plants require it.

The highest agricultural authorities have established by careful experimen- tation that 100 pounds per acre Nit- rate of Soda applied to crops has pro- duced the INCREASED yields tabu- lated as follows:

Barley	400	lbs. of grain.
Corn	280	" "
Oats	400	" "
Rye	300	" "
Wheat	300	" "
Potatoes	3,600	" Tubers
Hay, upwards of	1,000	" Barn cured
Cotton	500	" Seed cotton
Sugar Beets	4,000	" Tubers
Beets	4,900	" "
Sweet potatoes	3,900	" "
Cabbages	6,100	pounds.
Carrots	7,800	pounds.
Onions	1,800	pounds.
Turnips	37	per cent.
Strawberries	200	quarts.
Asparagus	100	bunches.
Tomatoes	100	baskets.
Celery	30	per cent.
Hops	100	pounds.

Nitrate of Soda is a plant tonic, and an energizer; it is not a stimulant in any sense of the word.

Nitrate of Soda may be used alone without other fertilizers, as a Top Dressing, at the rate of not more than 100 pounds to the acre.

How to Learn About It.

The Nitrate mines in Chili are su- pervised by the government and au- thentic information is annually circu- lated about Nitrate of Soda among those who should profit by it. For this purpose the Nitrate of Soda Propaganda is maintained. Advertisements have been placed in the leading agricultu- ral papers and offices established at John Street and 71 Nassau Street, New York, for giving out information in regard to actual tests made with Ni- trate of Soda and as to its uses.

OLD-FASHIONED WHEAT CROPS

Big stalks, well-developed heads and large kernels—the best, whether you sow for hay or wheat—will be *assured* if you use

Nitrate of Soda used here

Nitrate of Soda

No Nitrate of Soda used

The two wheat fields illustrated above tell their own story. By tests carried on all over this country, it has been demonstrated that 100 lbs. of Nitrate of Soda to the acre has resulted in an average increase of 300 lbs. of wheat on each acre. It is the standard nitrogenous fertilizer, and the cheapest.

TEST IT FOR YOURSELF ENTIRELY FREE

Let us send sufficient Nitrate of Soda for you to try, asking only that you use according to our direc- tions, and let us know the result. To the twenty-five farmers who get the best results, we offer, as a prize, Prof. Voorhees' most valuable book on fertilizers, their composition, and how to use for differ- ent crops. Handsomely bound, 327 pages. Apply at once for Nitrate of Soda, *as this offer is necessarily limited.* "Food for Plants," a 237-page book of useful information, will be sent free to farmers while the present edition lasts, if paper is mentioned in which this advertisement is seen.

Send name and complete address on post card.

WILLIAM S. MYERS, Director, John Street and 71 Nassau, NEW YORK

Resuls on Hay.

For three years samples of Nitrate of Soda have been sent to farmers experiment on Timothy. In each case two patches were marked out in the hay field, side by side—each about 20 feet square, about 1-100 of an acre. One received Nitrate of Soda, equiv- alent to 100 pounds, per acre, the other had none. The following are fair samples of the results reported, giving the weight of cured hay in each case:

Horace Field, Mattapoisett, Mass.
Plot without Nitrate, 60 lbs. Plot with Ni- trate, 90 lbs.
"Hay was well made. Nitrate plot ready to cut 10 days earlier than plot without Nitrate and the growth now is much heavier on the Nitrate plot."

William Norman, Toledo, O.
Plot without Nitrate, 36 lbs. With Nitrate 62 lbs. "This is what I call dynamite soda"

E. P. Nance, Oak Level. Ky.
Plot with out Nitrate, 70 lbs. Plot with Nitrate, 104 lbs.

Ole O. Hatledal, Benson, Minn.
Plot without Nitrate, 20 lbs. With Nitrate, 52 lbs.
"Plot with Nitrate now thick with grass again and will produce second crop of hay. Plot without Nitrate will not be worth cut- ting again."

Herbert J. France, Blairsville, Penna.
Plot without Nitrate, 63½ lbs. With Nitrate 118 lbs.
"Hay was thoroughly cured when weighed. Plot with Nitrate kept six or eight inches ahead all summer."

Alonzo J. Bryan, Hunterdon. N. J.
Plot without Nitrate, 31 lbs. With Nitrate, 63½ lbs. "The Nitrate made wonderful re- sults."

Chas. P. Groth, Springville, N. Y.
Plot without Nitrate, 78 lbs. With Nitrate, 147 lbs. "Cut Nitrate plot twice."

E B Strong, Cauming, Nova Scotia.
Plot without Nitrate, 68 lbs. Plot with Nitrate, 91 lbs. "Much pleased with results."

Leonard D. Spicknall, La Belle, Mo.
Plot without Nitrate, 44 lbs. With Nitrate 69 lbs. "I consider Nitrate of Soda a most valuable producer as hay seems softer and brighter from Nitrate plot than from the other."

The average of these tests show increase of 2,775 pounds of field-cured hay per acre with the use of 100 pounds Nitrate of Soda. Bearing in mind the cost of Nitrate of Soda per 100 pounds, it is very evident that it pays to use it.

The Purpose of the Nitrate Propaganda.

Free books, bulletins and all de- desired information are promptly for- warded to farmers interested. Thou- sands of farmers of the United States have seen Nitrate of Soda advertise- ments and thousands have written in answer to them for free books.

No Nitrate is sold by the Nitrate Propaganda; it is maintained simply to put the facts clearly and accurately before the cultivators throughout the country, and rapidly they are finding ical form of supplying their crops est and by far the most prac- with Nitrogen. It is the only existing instantly available Nitrogenous Food for Plants.

Free Information.

To a limited number of farmers who want to know the Propaganda, in ad- dition to bulletins from agricultural experiment stations, giving results of actual trials with Nitrate of Soda, is sending a handsomely illustrated book, which any farmer may understand, and which should be in the library of every farm in the United States.

Farmers who may not care to make any of the experiments who would like to know the results that others have obtained or who desire any in- formation whatever concerning Nitrate of Soda, should write to William S. Myers, Director, John Street and 71 Nassau Street, New York.

California Cultivator

Los Angeles March 21, 1907 San Francisco

Vegetable Gardening in California

THE financial importance of the home vegetable garden is rarely appreciated, except by those who have all their vegetables to buy. Such a garden, even in its highest degree of perfection, may not bring in one cent, but it's difficult to estimate the dollars it keeps in the family purse. Its importance should be estimated from the amount saved and not from the amount made or cleared; and aside from the economy, pleasure and commendable pride that the owner derives from a well kept garden, he has the satisfaction of knowing that he is providing his family with fresh and wholesome food, lessening his drug and doctor's bills, and very probably prolonging the lives of those dependent upon him.

Our favorable soil and climate, increasing population of cities, and better transportation facilities have made possible the development of the vegetable growing industry, whether the product is intended for home or eastern markets. Few avocations require more intelligence and business tact than truck farming, and experience is necessary to its successful undertaking. The average man who, for the first time, engages in truck farming does not appreciate, or even recognize, the many essential details of the business, and fails in his undertaking and declares there is no money in it, or that soil or climate are unsuited, while, in the majority of cases, the real cause of failure was the man.

The capital employed may not have been sufficient for the area cultivated; the soil may not have been put into condition for producing a paying crop; fertilization may have been inadequate, or cultivation improper or insufficient—or, it may be that the gardener was of the opinion that his successful culture of general farm crops in the past insured his successful culture of potatoes and onions in the future. Though a truck farmer be well equipped for the undertaking, he is fortunate if he pays the expenses of the first year's operations.

The lack of appreciation of the advantages of our soil and climate, and ignorance of the requirements and hardiness of common plants, deprive many homes of fresh fall and winter vegetables. That a number of our most common vegetables will withstand our winter climate all over California and even repeated freezing is not generally understood, and the consequence is that no effort is made to grow them. We may grow many garden crops throughout all seasons, and such table delicacies as lettuce and radishes may, in many sections, be sown with profit each month in the year.

Citrus Culture and Allied Subjects

A Lecture Delivered Before the Southern California Horticultural Society, March 11, 1907

By DR. C. J. K. JONES, Director of Study and Research, Los Angeles Public Library

THE production of citrus fruits in commercial quantities in the United States is a matter of practically only 40 years. Previous to 1870 there were some sweet seedling groves, principally on the Indian river, Florida, such as the famous Dummit grove on Merritt's Island.

Scattered here and there among the native white homes of Florida were a few seedling trees, which had developed from the seeds brought in mainly from Indian river, which the women had planted because the trees made a good shade around the house.

These seedling trees were the starting point for that development of the orange industry in Florida, which in the winter of 1893-94 had reached a crop of approximately 6,000,000 boxes, but which by the freezes of December 1893 and February, 1904 was reduced in the following year to 250,000 boxes. It was about 1875 or '76 that there commenced the budding of wild orange trees in the hammocks. One of the most famous of these groves was the Bishop grove at Citra, whose crop one year was bid for at $60,000 on the trees. These wild trees were the result of the Spanish invasion of Florida, which brought the sour orange (Citrus Bigaradia) into that territory and whose seeds were scattered by the agency of man and animals. In passing I may say that the seedling groves to which I have referred became very valuable.

For the Judge Speer grove near Sanford, $60,000 was offered and refused. The grove was less than five acres and netted $5000 to $6000 annually. It was killed to the ground in the disastrous freezes in the winter of 1893-4 and never revived. Sweet stocks will not withstand shocks of cold, or of mutilation, as will the sour orange and rough lemon stocks.

The great orange boom in Florida was in the decade 1880-1890. Thousands of acres a year were set out. 1894, the year of the great freeze, witnessed the collapse of the boom, but not of the industry. There were stout hearts and strong arms, supported by a firm faith in the possibilities of a great fututre for the orange industry. The center of the citrus culture moved farther south, but not all the grove-men, by any means. There are single thriving groves in the old districts, but their number is small. The President of the Florida Horticultural Society, G. L. Taber, has a profitable grove and nursery at Glen St. Mary, in North Florida, near the Georgia line.

It is on this place that the Government is experimenting by cross-breeding and hybridization to secure a hardy orange that will stand freezing temperatures and produce in marketable quantities. I have seen that experimental grove and tasted its fruit. Growers of citrus fruits in semi-tropical regions in the United States, need not have any fear of serious competition from the results of that experiment for many years to come—if ever. The fruit and I may add the trees are about as unpromising to the average citrus grower, as anything in the citrus family can well be. A trifoliata hedge is a thing of beauty, and a joy, if one keeps away from its thorns, compared with the hybrids I saw in September 1903 at Glen St. Mary.

The development of citrus culture in California is familiar to you all. If I say it is practically a period of twenty years for which oranges and lemons have been produced in commercial quantities, I shall not be far out of the way. Ten years ago, California produced a trifle over 5,000,000 boxes—the statistics say 5,063,294 boxes of oranges and 363,792 boxes of lemons, something over 15,000 (15,153) cars altogether. The potential output in a normal season is now some 30,000 cars.

As compared with other fruit industries, citrus culture in the United States is only in its infancy. Relatively speaking we are just beginning to know the scientific principles and practices, which underlie its successful prosecution. There is much that we can learn from the methods of other countries, but as applied to the conditions of citrus culture in the United States there are many old world usages and ways in the culture of citrus fruits, which we must revise (of various kinds of stock on which to bud—as related to climate, soil, transportation and market, etc.).

Again, what will do in Florida will not do in California, except in a general way; the conditions of soil, seasons, moisture and culture being radically different in some particulars. The instructed, observant, and thoughtful man will learn wherein he must adapt himself to the conditions under which he is placed. Of course there is a common basis of knowledge on this subject, such as the apprehension of certain facts in regard to soil physics, its chemistry, and biology, the nature of plant physiology and pathology, as also its biology, and especially the characteristics of the plant-life under cultivation in its multiplied relations.

Having been a hard student and reader for over forty years I may say that I know of no calling that involves such a wide range of theoretical and demonstrated science, and practical experience, as is involved in the culture of plant life, when such culture is carried on intelligently, which is to carry it on successfully, all other things being equal. In this respect citrus culture takes a foremost place and has multiplied problems.

With the habit that is strong on me, permit me, before going farther, to recommend what is altogether too rare among a majority of horticulturists, the habit of diligent, thoughtful and consistent reading on the various subjects related to your particular industry, in the horticultural field. Money spent for books and literature thereon, and read carefully, is one of the most profitable investments one can make both intellectually and as a monetary venture. I have repeatedly observed where men lost thousands of dollars which an elementary knowledge of modern "book farming" would have prevented.

In this state every citrus grower should possess the late works of Lelong, Wickson and the Agricultural Experiment station bulletins. If possible, also Garey's and Spaulding's smaller works. To know what Florida has done, and is doing in the way of a generally accepted practice, "Citrus Fruits and Their Culture," by H. Harold Hume is the best resumé. There are some bulletins by the United States Department of Agriculture which, relating to our subject, are of value. Our English brethren in Australia are also putting forth some valuable literature on the culture of the citrus and its diseases. Italy also.

But in addition to this literature, which is specific, I would recommend the reading of some reliable books on plant physiology, pathology or diseases of plants and trees; on the soil, its chemistry and physics; on bacteriology and on general chemistry, and by all means an up-to-date paper, which has some intelligence in it beyond the purely commercial instinct. The outlay for such literature will cost only a small sum, but did it cost many times its present purchase price the pleasure and profit derived therefrom would abundantly repay the sum expended.

King on "Phsyics of Soils" and King on "Soils;" Hilgard's "Soils," a book which I especially commend for its specific treatment of soils and for much valuable matter collateral thereto. Harry Snyder's small work on the "Chemistry of Soils." In this connection I may mention that Prof. Johnson's "How Plants Feed" and "How Plants Grow," although published more than a quarter of a century ago, are not without much value. Prof. Storer's new edition of his "Agriculture" in three volumes; the last edition contains a general resume of theory and practice that is almost cyclopaedic.

To those who can afford it, the "Cyclopaedia of Horticulture" four volumes (6 in last edition) and the forthcoming "Cyclopaedia of Agriculture," of which the first volume is out, under the editorship of Prof. Liberty H. Bailey of Cornell University, who is the leading authority on the general subjects treated of in these books, will be of great and daily service.

The "Farmers' Cyclopaedia" by Wilcox and Smith, in one volume, is a valuable reference work. On vegetable physiology the great work is by Prof. Wm. Pfeffer of Leipzig—three volumes—$22.50—too elaborote for the average reader as it is too expensive. A modern, well-illustrated botany will serve the ordinary purpose. Such a book is Prof. Campbell's of Leland Stanford University. There should be in every horticulturist's collection of books a work on plant diseases, and also on fungi. The writings of Geo. Massee—the English author—are up-to-date, exact, but exceedingly easy of understanding. His "Text-book of Plant Diseases," and text book of Fungi—just out—will cost only a matter of four or five dollars.

I have seen horticulturists and agriculturists sacrifice many score times this sum because they did not know what the former book on "Plant Diseases" would have taught them. Comparatively few citrus growers there are, who distinguish between injuries to their trees caused by gophers, and those caused by bacterial and fungous agencies.

Bountiful Orange Crops

Every soil has so much growing power per acre, just as a boiler has so much horse-power per square foot. To keep this growing-power up to the maximum, you must keep the soil supplied with the necessary fertilizing elements, just as you must keep the boiler supplied with fuel and water. Therefore, use

POTASH

A maximum yield of oranges is impossible without a good supply of Potash in the soil. A complete fertilizer containing at least 10 per cent. of Potash should be used.

We want to send you our free booklet, **"Orange Culture."** Write for it if interested in growing oranges.

Deciduous Fruit Culture

By J. W. MILLS

INFLUENCE OF STOCK ON SCION.

SOME years ago, experiments were made by grafting pears on seedling pear roots and on quince stock. Triomphe was the variety used. The trees had been growing side-by-side for fifteen years when the tests were made, and all were apparently subject to all the conditions which were comparable, except that of stock. The trees bore about 300 fruits each and the tests were made for three consecutive years, mature fruit being used of course. Analyses were made and results tabulated.

The color of the fruit was very different, those upon the pear stock being green and those upon the quince being of a golden yellow with a decided rose blush on the side towards the sun: Some of the other differences of the two fruits were, that those from the quince stock were considerably more dense. Ten average fruits weighed over four ounces more than those grown on the pear stock; they contained more sugar and more acid than those on the pear stock. It was estimated that the fruit taken from the pear root tree contained a little less than fourteen pounds of sugar while that from the quince root tree contained about twenty-one pounds of sugar.

These figures were confirmed by a similar experiment carried on for several years on Doyenne pears grafted, upon quince and pear stock. The difference is said to be due to the greater activity of the chlorphyll in the case of the quince stock.

It must be remembered that quince stock makes a dwarf tree. It forces the tree into quick bearing, some fruit being produced the second year. They are especially desirable for interplanting with walnut trees where interplanting is practiced. Their rapid development, dwarf size of trees, large size and fine quality of fruit make them desirable for this purpose.

Quince stock has the advantage of being partially resistant to alkali. Trees growing on the Chino ranch have made a uniform growth on varying amounts of alkali. They also are quite resistant to flooding; trees in the Bear river bottoms in the Sacremento valley have stood without injury, while other varieties were badly injured.

The following varieties of pears are said to be well adapted to growing on quince root. Beurre Hardy, Doyenne du Comice, Duchess d'Anroulеme, Beurre Diel, White Doyenne, Winter Nelis, Colonel Wilder, Patrick Barry, Glout Morceau.

MIXED ORCHARDS.

The old method of planting large areas of deciduous trees to one variety is not as popular as it used to be, especially with certain varieties of plums. Almonds and apricots produce better when varieties are planted close together. We have in mind an orchard of two varieties of plums, there being but about three acres of each. The product of the four rows where the varieties joined bore more fruit every year than the entire remaining area. The soil and care was the same, but the results of about eight years showed a big advantage in having the varieties mixed or planted in small adjoining blocks.

Prof. Waugh, perhaps the best authority on plums in America, has made some interesting experiments on the behavior of plums when grown under different conditions. He found that when he covered about 500 blossoms of various kinds of Japanese plums with bags so that the pollen from others could not reach them, not a single fruit was set. Of 6000 isolated blossoms of sixty varieties of American plums, he only got five plums to set.

He also found that about 15 per cent. of all kinds had on an average, defective pistils and were incapable of setting fruit under most conditions. He said, "The health of the tree has a great deal to do with the condition of the pistils, a healthy Burbank plum having but 2 per cent. of defective pistils while a tree dying from the effects of brown rot fungus, 58 per cent. were defective.

Repeated observations have shown that buds so situated upon a branch as to command a relative large storage of food, have as a rule large blossoms, large ovaries and perfect pistils, while other buds less favorably situated on the same twigs develop sickly looking blossoms with pistils weak and wanting. Any condition of an entire tree which prevents the normal storage of food material in buds and branches is likely to show in defective pistils at the next blossoming time. A tree of Wolf Seedling which bore much too large a crop in 1896 had not a perfect blossom in 1897."

There is a lesson in this. If the lack of bud and fruit producing material causes imperfect blossoms, would not some experiments in fertilizers be a good thing for deciduous fruit growers to take up? It may prove to be a very profitable thing to do. The deciduous fruit growers of California have given this part of their business little or no thought. It was one time thought that irrigation was not only unnecessary, but harmful to the fruit. This is all changed now and it may not be long before intelligent fertilization will be one of it adjuncts to deciduous fruit growing.

RESISTANT FRUITS.

"I think it of interest to note the value of some accidental as well as studied and premeditated crossing (pollenization) of fruit of the above named families, that are now found to be wonderfully strong in constitution, free from diseases and exceedingly prolific. In North Texas, twenty-five years ago, Prof. T. V. Munson, of Denison, started to experiment in the cross pollenization of a number of the American and European grape vines with the wild (post oak) grapes of Texas; his object being to secure varieties having deeply penetrating, drouth resisting roots, such as the native (post oak) grapes possess; and at the same time get the flavor and sweetness of the finest American varieties. The professor has made over seventy-five thousand of such pollenizations and has from the pollenized seeds grown more than seventy-five thousand seedling vines, taking from years and upward to test each young vine for fruit, and throw away the poorer ones. From this vast number he has retained but thirty-nine varieties as worthy of propagation and recommendation to the public. His standard of judgment is: Is the grape as sweet or sweeter, and as well or better flavored than the Concord? Is it drouth resistant? Is it free from black rot, mildew or other diseases,

and finally, all things considered, is it a profitable and desirable grape to raise? If below the standard in any of these particulars it is rejected.

"Prof. Munson has done for the United States, and especially in grapes, what Luther Burbank of Santa Rosa, California, has done in new varieties of plums, nuts and vegetables.

"Turning from grape vines to that magnificient fruit, the pear, it may be of interest to relate somewhat more fully the history of the Sudduth pear; the parent tree being probably the largest pear tree in the world.

"Eighty years ago Thomas Constant, then a young man, came from Ohio to Illinois, settling on, and homesteading a piece of land twelve miles from Springfield, the capital city. He brought with him, among other seeds to plant in the new country, three little pear seeds. All three grew, but two were crowded, broken down and died; the third survived and now stands a monarch of fruit trees, 60 feet tall, and is over 12 feet in circumference at the height of a man's head above the ground.

"The editor of the Farm News of Springfield, Ohio, who with a large party of newspaper men and horticulturists from different states, visited this remarkable tree six years ago, stated in his paper that upon interviewing a number of old farmers in that vicinity they all declared the tree has never failed to bear a crop any year since it began to bear in 1826. The farm at Constant's death came into the hands of Judge Logan, Abraham Lincoln's law partner; he rented the land for half of produce and fruit, and it is of record among his papers that one year his share (half the fruit of the one tree) was 60 1-2 bushels, showing the crop that year was at least 121 bushels. Neither this old tree nor any of its children, propagated by farmers of the neighborhood or by Augustine and Company, of Normal, Illinois, its present owners (who bought from Mr. Sudduth, the successor of Judge Logan), have ever blighted in the least, but have always been blight proof, though standing at all ages in different states surrounded by blighted and dying trees of other varieties. Another peculiarity of this fruit is that it has no core, nor seed, nor hard gritty substance in its center; is sweet, juicy meat all the way through and is on this account eminently useful for preserving.

'John W. Yokum, of Williamsville, Illinois, bears the same testimony that hundreds of others who have long known and fruited this pear. He says: 'This fruit has always been in demand and sought after at the highest price. I consider it one of the best varieties of pears I ever ate, and for canning, pickling and preserving there is none better.'—E. M. P., in Texas Farm and Ranch.

PEACH TREE BORER.

All peach growers are familiar with the borer in the larval stage. For, as among most other insects, there are four stages in its life history; first, the egg; second, the larva; third, the pupa, and fourth and last, the imago, or perfect insect, which in this case is a swift flying, bright colored little moth, measuring an inch to an inch and a half across the expanded wings, and strongly resembling a wasp in appearance.

The moths are not often seen, and even then few know of the relation they bear to the peach tree borer itself. The waspish appearance is undoubtedly a protection in many ways. They should be invariably destroyed when found.

These moths are very prettily colored. The wings of the male are transparent and only bordered with blue, while the fore wings of the female are blue throughout. The abdomen in both cases is blue, but that of the female is encircled by a broad orange band.

During the spring these moths lay their eggs, which are yellowish brown in color and very small, on the bark at or near the surface of the ground. The eggs soon hatch, and the minute larva makes its way as rapidly as possible beneath the bark of the tree, where it at once begins feeding.

It is at this point we look for a reason for the deposition of the eggs near the surface of the ground. We find it in the fact that the jaws of the young larvae are too weak to pierce the tough and hardened bark above but just beneath the surface of the ground they find entrance an easy matter.

Underneath the bark the larvae or borers feed through the summer, and in the extreme south on and on all winter. At the opening of the burrow there usually occurs a more or less copious exudation of gum, which is usually mixed with the droppings of the larva and with borings from the hole. This external evidence of the presence of the new worm is first observable about the middle of the summer. The larva frequently works well down into the the main roots.

The next spring regular feeding is resumed and continued until full growth is reached. In the far north this occurs in July or later. In the South the first larvae matures very much earlier, and continue "coming on" throughout the summer. Here at Auburn larvae of all sizes may be found in tne trees at almost any time during the summer, thus rendering it very difficult to outline any well-defined brood.

As soon as full growth is attained, the larva forms about itself a protecting cell wall or cocoon of silk and refuse, and within this changes to a pupa. In the pupal stage the larva loses largely its power to move, and takes on characters which somewhat roughly outline the future moth. It remains in this stage usually but a few days, soon shedding its pupal skin and appearing as the moth we have already described, thus completing its life cycle.

It is very evident that with such an extended term of life allotted it, a great deal of injury is possible with even a single larva. The chances of life are indeed small for trees infested as, for instance, those of a very badly neglected orchard in Alabama examined by Prof. Earle, some of which had as many as fifteen and sixteen worms each.—Alabama Experiment Station.

"Why," asked the judge, "did you deliberately get in the way of this man's automobile?" "Because," muttered the wrinkled crone, "I wanted to be described as being young and pretty once more before death."

"An amendment was tacked to John Skinn's epitaph. It consisted of one word, the word :friends.' It was put on in the dead of night. The epitaph, previous to the amendment, read: 'He did his best.'"

WILL NOT STRIP THE BRANCHES

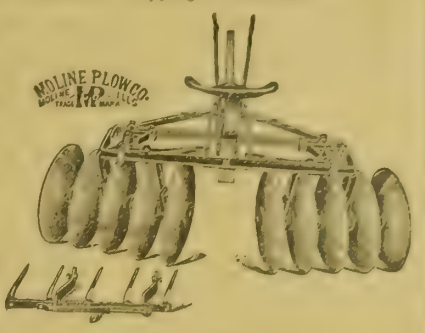
The Moline Reversible Disc Harrow is an ideal tool for orchard cultivation. The frame is built down close to the discs making it lower than any other harrow of its class; the levers are short and always in the center, making it practical to work under low hanging limbs without stripping the branches.

The harrow is all steel and iron excepting the pole.

The discs may be reversed in a moment without taking them from under the frame.

The gangs may be tilted by a simple adjustment of the malleable frame spreader.

Bearings have a double set of wood blocks, giving twice the wearing surface to meet the end thrust.



For Orchard Work the Moline Reversible is equipped with an extra long frame instead of extension head.

The correct design, great durability, ease of handling, low build, arrangement of levers and adjustment for setting the gangs in and out on the frame makes this an all around harrow. Protected by patent. Made in four and five foot, 16, 18 and 20-inch discs; four and five foot, 16 and 18-inch cut out discs.

Before buying a Reversible Harrow ask your dealer to show you the MOLINE.

Send Us Your Name and Address, enclose four cents in stamps to pay postage and mailing, and we will send you our **FLYING DUTCHMAN SONG BOOK** and Junior Catalogue Combined, containing Twenty-six old Familiar Songs with words and music.

With the Citrus Growers

By J. W. MILLS

SUBSOILING ORANGE GROVES.

THE use of the deep subsoiler in orange and lemon groves was one of the things conceded to be of great advantage a few years ago. Little or nothing is heard of it now, though some lemon growers use it occasionally and some of our best orchardists use it on sloping land as a check for holding the winter run-off during heavy rains.

Mr. Mills, of the Arlington Heights Fruit Company, finds that it works to great advantage in this way. He runs it cross-wise with the steep slope. When the rain sends an excess of water down the slope, it strikes these cross furrows made with the subsoiler and the water sinks into the ground. This serves two purposes. It fills the soil with the maximum amount of water and prevents washing at the same time.

We believe this is the most intelligent use of the subsoiler that we have yet observed. It takes the tree when it is in the most dormant state possible and when the least amount of evaporation is taking place. Root pruning is effected at the same time and this is now considered an important adjunct to orange growing; some of the most successful growers now practice it regularly, though not on the wholesale scale as was done in the past.

The subsoiler has done considerable damage by injudicious use, and this has a tendency to make most growers slow to use it. There are groves in Riverside, for instance, that we are told have never recovered from the effects of the subsoiler. It was used during the hot summer time to get the irrigation water deep into the soil. It did this, but the feeding roots and 90 per cent. of the whole root system was so far above the water as it was applied, that before the owner knew it the trees were so badly injured from lack of water, that several years of careful culture have not brought them back.

PREVENTION OF HARDPAN.

Under better treatment of water and soil, especially where the soil is less susceptible to the hardening process, the hard layer does not reach a stage to be properly called hardpan. But as the object of the orchardist should be to keep the root-bed in a moist condition continuously, this discussion is generally pertinent. What makes the existence of this dry hard-pan stratum the more serious is that it is found at just the right depth to incase the largest amount of feeding roots.

Now, knowing the cause of this troublesome obstruction, can it be prevented? Most certainly. You will find one orchard dwindling and unsatisfactory because its roots are incased, if not in real hard-pan, in hard dry soil most of the time. Adjoining is another bright and thrifty, because the root-bed is in favorable condition all the time. To prevent hard-pan is simply to keep this stratum sufficiently moist to prevent hardening. If you admit this, as I think most of you will, the problem is reduced to the best manner of putting in and retaining this moisture.

But before entering on the old ground I want to speak of a factor which has been less discussed, the importance of which I do not think is sufficiently appreciated. Underlying a large portion of our orchards, have a subsoil of considerable dept If this bed of soil several feet thi immediately under the root stratu proper is kept saturated, it will n only encourage deep-going roots, b will render a most important servi in helping retain the desirable equi brium of moisture in the root-bed self between irrigations.

This draft from the lower reserv is considerable, but is readily made from the irrigations, but the wat passing quickly through the yet moi root-bed. This reservoir should filled so far as possible by coveri the rainfall, and running irrigati water in winter, when the root-b does not need much, if any.

Those who have not practiced kee ing the surface in best condition t taking in the winter rainfall and ut izing extra irrigation water, will surprised to find how much this stor supply will help when the drying da come.

But, of course, the root-bed mu mainly depend on the regular irrig tions for its moisture, and how best get the water down to it mo thoroughly and economically and ho and keep it there when once down the most constantly important pro lem of the orchardist.

POSITION OF BUDS.

At a recent meeting of the Lem Men's Club, the subject of placi buds in nursery stock was discusse It was the opinion of the majori that nursery trees should be budd at least a foot above the ground f the reason that it left a more har standard for a considerable distan above the ground and thus gives le chance for the ill effects that mig follow poor soil condition that mig be brought about by improper irrig tion or other treatment. One of t leading citrus nurserymen of t state thinks such budding will ma the best tree, but will not bud th way, because the buyers might n want the trees.

The fact that the question of hig budding has been raised, sugges that there is more in it than is fir seen on the surface. From the fa that sour stock has been known to r sist sap diseases common to oran trees better than the budded varietie as also does the pomelo and roug lemon, it would seem reasonable suppose that if it ran up high enou to bring the bud wood above any co taminating influence of the soil, would be a point in favor of such method. There is an orange grov near Pomona, which is budded Washington navels on Florida So Stock, the buds having been place eighteen inches to two feet above th ground. We have inspected the grov for scaley bark gum disease and hav questioned the owner and neither c us have found a trace of the diseas below that limit, but quite a numbe of the trees have it on the trunk above and on the branches. This only one case and of course it is n criterion, for "One swallow does no make a summer." When numerou growers think they can see an ad vantage the question is surely wort looking into.

A hard character always is a weal one.

The self-satisfied seldom are satis factory.

TREES

True to Name

ROEDING TRUE TREES FRESNO. CAL.

Cool weather and bountiful rains have done much to prolong this season. Planters should get their orders in immediately if they desire to secure a complete assortment.

We are still in a position to furnish leading varieties of

Apricots, Peaches, Nectarines Apples, Pears, Cherries, Almonds, Grape Vines Roses

and are prepared to offer special inducements on quantities.

Citrus

Trees: Our assortment of leading varieties is still complete. All are grown in the great thermal belt at Exeter, Tulare County, Cal.

Olives

Our assortment of oil and pickling varieties was never better. Our catalogue tells all about them.

Roses

It will be worth your while to write us for our list of varieties we still have in stock. We still have many of the leading and best sorts.

Four New and Valuable Burbank Creations

Our illustrated booklet tells all about them.

Santa Rosa Plum
Rutland Plumcot
Paradox and Royal Walnuts

We are the sole propagators and disseminators of the Burbank creations and we will gladly give any information regarding these great specials.

Our New Catalogue

Our new catalogue is remarkable for its completeness. It contains much valuable information, and is superbly illustrated. Mailed free to any address. Price list on application.

California Horticulturally

By JOHN ISAAC, Sacramento, California

OVER PLANTING OF GRAPES.

THE cry has gone forth again that grape planting is being overdone, and those who already have good paying vineyards are warning those who have not to beware of planting. lest profits may be reduced. Ever since we have any recollection of fruit growing in California, and that covers a generation, we have heard the same advice given and it has always gone unheeded. People have continued to set out new orchards and to plant new vineyards and still have found a market for the increased output. The fact is, that those who give such advice see things as they are and not with the eye of prescience. They know that the present outlook nearly equals the demand, and while observing the increased output cannot realize that there is also an increasing demand. We should never advise anyone to stop planting. Go on, plant and take your chances with the rest, and by the time your orchards and vineyards come into bearing there will be a market for the product. The population of the United States is growing with wonderful rapidity, new country is being developed, new markets opened. Railroads are being built everywhere, and the markets are being widened faster than we can hope to supply them. There is little danger of overproduction, and in any event, it will only be an overproduction of the worst, there will always be a demand for the best.

FIGHTING CODLING MOTH.

The season has arrived when it is necessary to commence active warfare against the codling moth pest, if marketable apples are desired. The parasite for this pest, while it is doing good work, from reports which have been received, is still not yet found in sufficient numbers to warrant full reliance being placed upon its work in controlling the worm. There need be no hesitancy about spraying where this parasite has been established, as it is a pupa parasite and does not attack the moth until it has left the apple and has commenced its changes into the pupal condition. As the poison sprays are used to catch the worms before they enter the fruit, it cannot be eaten by the parasite. It is therefore safe to spray, even though the parasite has been established. This is not true, however, of internal parasites, those which enter their hosts and stay with them in all their changes. In such cases spraying which will kill the host insects will also kill the enclosed parasites. This is the case with all parasitic enemies of scale insects, and therefore where parasites have been introduced for this class of insects spraying and fumigating must be avoided unless it is desired to kill both enemies and friends at the same time.

PEAR BLIGHT CAMPAIGN.

The season's war on the pear blight in the northern counties has been brought to a close, and with good prospects of victory. It is during the winter season, while the trees are dormant, that the best work can be done, as the blight is then very manifest, is not spreading, and can be thoroughly removed. The great object to be attained is to remove all the hold-over blight. It is from this hold-over that a new start is had in the spring, and if this is removed, there are no germs left for a fresh start, the source of infection is gone and the disease stopped. The work done last year demonstrated the practicability of this method, and such good results were obtained that the work has been taken hold of with more spirit by the growers this season and has been more thoroughly done. Of course, the Washington experts have not eradicted the disease, but they have demonstrated that, with eternal vigilance and conscientious work, Bartlett pears may still be grown in California.

DR. JONES' LECTURE.

Special attention is called to the leading article in this issue by Dr. C. J. K. Jones. Dr. Jones has long been recognized as one of our leading horticulturists, having made a deep study of the science for a period of forty years.

Of late years he has made a most exhaustive study of citrus culture and to make it thorough and practical has owned (and resided in) groves in both California and Florida. As a thoroughly practical and scientific writer and lecturer on the orange we believe he has no superior.

NEW HORTICULTURAL REPORT.

The Second Biennial Report of the Sate Commissioner of Horticulture has been received from the State printer and is now in the hands of the fruit growers of the state. The report is one of the best ever issued and covers a wide range of subjects of interest to the fruit grower. Copies can be had on application to the State Horticultural Commissioner.

I am particular about eating. Nothing but Purina for me, for I'm a Checkerboard Chick. See my ad, page 315.

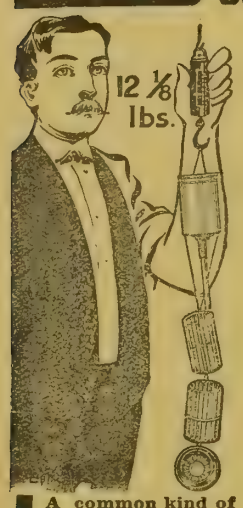
The Difference
Comes Out of YOUR Pocket



A common kind of "Bucket Bowl." Heavy, hard to wash, easy to rust.

SHARPLES Dairy Tubular Bowl. Simple, light, durable, easy to wash.

If you don't **know** that Sharples Dairy Tubular Cream Separators are **different,** take no chances until you find out. "Bucket bowl" agents depend on catching the fellows who **don't** know. Don't let them take the difference out of **your** pocket. One difference is in the bowl.

Shake The Insides Out!

Before you buy a separator shake the insides out of the bowl. It will show you how heavy, complicated, hard to wash, easy to injure, quick to rust, "bucket bowls" are as compared to Dairy Tubular bowls. **Sharples Dairy Tubulars are different.** Nothing inside Dairy Tubular bowls but a small dividing wall of triple tinned pressed steel—no bigger than a napkin ring—good for a lifetime. Yet Tubulars have twice the skimming force of any other separator—skim at least twice as clean.

You have common sense—want to save your wife work—want to save yourself repairs and cream—so why not learn about this now? Our free catalog N-260 shows many other exclusive Tubular advantages of great importance to you. Also ask for free book, "Business Dairying," covering everything from calves to butter.

THE SHARPLES SEPARATOR CO.,

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

ALL ABOUT MILK.

CHEMISTRY as a science has newly entered into the practical side of everyday life. The safeguarding of the food of the nation by the aid of chemical analysis of the food stuffs sold in the markets, has only been in use for the past decade.

The National Government has attempted to throw a safe guard around all food stuffs that were exported or imported. The states had each to pass their own Pure Food bills. This wave of feeling began long before that terrible book, "The Jungle," was written; it began in the pitifulness of the death of the wee babies in the slums from want of milk. The milk was furnished—when the want was found to be deeper; it was good milk, pure milk that was needed to stop the terrible mortality.

The cities resolutely took to enforcing the sanitary rules on the dairyman. He came first because the need of pure milk was recognized first, not because he was doing worse than the venders of other food products.

St. Paul's Baby Food.

Milk has been proven by chemistry to be a complete food, that is in balance for all creatures. St. Paul, wise as he was in the learning of his times, falls into the oriental error of thinking milk a light diet. He writes:

"Ye have need that one teach you again which be the first principles of the oracles of God; and become such as have need of milk, and not of strong meat. For every one that useth milk is unskillful in the word of righteousness; for he is a babe."

This was the view that the Hebrew took of milk.

Greek ad Roman.

The people of ancient Greece and Rome thought that men should not drink milk, but only children. The use of cow's milk might be said only to be universal today in the Anglo-Saxon countries. The white races regard milk, butter and cheese as necessary to a full diet.

The noble red man scorns the use of milk. I was told by a doctor the other day of how he was nicknamed "Papoose" by the Indians. A young buck had consumption and the doctor started to tell him what to eat, and said: "Drink plenty of milk." The Indian roused up and said: "Umph! Milk for papoose, I big strong man," and clapping his sunken chest walked away. The doctor soon found all the Indians were calling him "papoose."

Many oriental people are becoming milk users, and the demand for condensed milk has followed the English soldiers in many countries. California dairymen have been sending breeding animals in increasing numbers to Japan and Korea. The Koreans of the ranch all use butter. George, the boss man, tells me that at home they used the tinned butter, probably the renovated butter made from the bad store butter.

I often wonder where so much of it can come from, for there are seventy-five factories that are licensed by the Government. Did you ever know a farmer's wife whose butter was not gilt-edged? I never did. Yet where does all the bad butter come from?

Care of Milk.

The care of milk therefore, to keep it sweet, became a problem with the increasing use. The people demanded sweet milk delivered daily. The cities grew larger and larger and more and more demanded fresh vegetables and small fruits. The high prices of the near-by truck lands crowded the dairyman further away from the cities.

Now the wicked chemist came to the front. He found the chemicals that would keep milk sweet and yet give it no foreign taste. Simple substances often of low cost, figured as wonderful discoveries, and were sold at advanced prices, under fancy names, in brilliant cartons.

The dairyman's mail was full of circulars, post cards of the wonderful preparations, that were harmless. It was guaranteed to keep the milk and cream for twenty-four hours in the ordinary refrigerator. There was never a caution given that it was possible to use too much of the substance in the milk.

Neither was there a hint of the fact that it might be injurious to health. Indeed, the opposite was firmly impressed on the mind. I have, today, two letters asking me if I think it is fair not to allow dairymen to use preservaline when the butter-maker uses coloring matter and the cheese-maker rennet. This shows how little the dairymen understand today the "Why."

Oleomargarine.

There is no perfect law; exceptions and apparent contradictions exist everywhere in the world. Many people think the color in butter is the only way that it can be kept from imitation. It is a puzzling question to the advocates of the Pure Food bill. Some of the coloring matters formerly used were coal tar derivatives and therefore to be viewed with suspicion. Yet the coloring is its defense against the pure white oleomargarine. This is the only provision that prevents the use of this production instead of butter on the cheap resturant table. It defeats the packers in this way, by limiting the sale of it as imitation butter. The fight is now being waged to prevent the coloring of butter, hoping to bring the dairymen to terms in this way—man's inhumanity to man again to the front.

Pasteurizing of milk came into vogue for a short period. This was a laboratory success. In a commercial way the milk tasted unpleasant and did not raise a good cream. It also decreased the digestibility of the milk by destroying the natural lactic ferment. At present nearly everywhere the pasteurizing machinery stands idle.

Milking Machines.

The milking machine can be kept clean, and if this is done it will produce a raw milk of increased keeping quality. It, however, has one great disadvantage, you cannot see the milk until all is drawn, so that bloody milk and gargety milk may go into the lot.

I am not speaking of the effects of the machine on the milk yield of the cows, nor of the financial side of the expense of operation, but merely of the sanitary side. I can only hope the milking machine will be made perfect and cheap and that all will use it soon. It will remove a large part of the dirt from milk.

Humanity owes much to the fastidious man or woman; it is a great help to sanitary science that dirt is re-

Do You Know the Man Who Sells the Studebaker?

IT WILL pay you, before you buy a farm wagon, a buggy, a carriage, a vehicle of any kind or a set of harness, to

See the Man who Sells the Studebaker.

He has something of importance to tell you—of importance to your comfort, your safety, and your pocket-book.

* * *

For considerably more than a half century, Studebaker vehicles, and more recently Studebaker harness, have held *first place* in reputation for high quality, long service, reliability and all that goes to make vehicles and harness dependable and serviceable.

There *must* be a reason for this reputation.

People buy the Studebaker for one reason only, and that reason is:

They have found out by experience that they can *depend* upon everything bearing the Studebaker name.

That's why the largest vehicle factory in the world is required to fill the demand for Studebaker vehicles and harness.

And by the same token that is why it *will pay you* to see the Studebaker man before you buy a vehicle or harness of any kind.

* * *

We don't ask you to buy on reputation *alone*.

We don't seek to over-persuade you.

We have no catch penny "special inducements" to offer you.

But we *do* insist that you owe it to yourself and your pocket-book to look into this vehicle and harness question *thoroughly*, before you give up your good money for an article that may or may not give you good service.

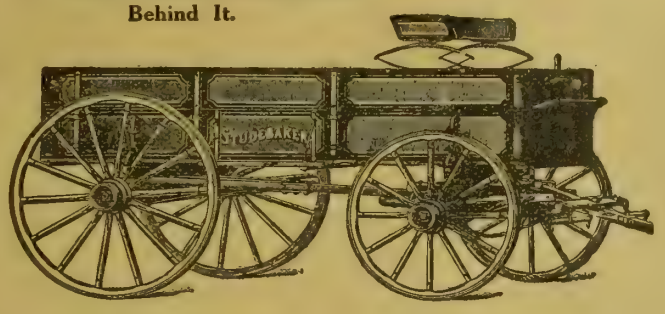
You don't buy a horse with your eyes shut,

You don't hire a man to work for you by the year until you find out something about him,

And you *ought* not to buy a vehicle or harness, until you know *what it's made of*.

And that's all we are urging you to do.

The Wagon With a Reputation Behind It.



Just go to the Studebaker dealer and *see for yourself* the good points of the Studebaker.

Find out *how* they are made;

Find out what *good materials* enter into them;

Find out what *infinite pains* are taken to guard every point of their construction;

Find out *why* they last so long and give such good service;

And you will be convinced that you *cannot afford* to buy anything but a Studebaker.

It means a saving of money to you,—in repair bills year by year, in long service, in safety, and in satisfaction.

SEE THE STUDEBAKER AGENT

and ask him for free copy of the Studebaker Farmers' Almanac for 1907.

If you don't know who he is write to us, and we will send you his name.

pulsive to some people. Take the average man milking cows; he will wet the teats with milk, let the cows switch in loose manure and hair, then at the table will drink a quart or two of milk. Let the dainty person see a tiny speck of dirt in a glass of milk and it is not possible to swallow it.

Tuberculosis.

The crusade against diseased milk is particularly against tuberculosis. There are families today that will not use milk because of this scare. The use of tuberculine renders danger to us impossible. The old idea of waiting until a cow was suspected of having tuberculosis was wrong; every cow should be tested.

The veterinary will test cows for any one, but he will be apt to tell some of his friends if he finds a reacting cow, for a secret is something that one person knows and runs to confide at once to some one else, for a secret unshared affords no pleasure to the possessor.

This fear of publicity has kept the dairyman from calling in experts to his assistance. He has simply disposed of the thin, weak cows by killing and burying them, without inviting in a corner or jury to call it justifiable.

University Aid.

The University has recognized the unjust censure that publicity has brought upon the dairyman who is willing to have his cows tested and dispose of the diseased ones. He was the man who reaped the reward of having the disease after it had been stamped out, while the man with untested cattle had never had the courage to tackle the idea and no doubt had cows that would react, but he escaped all censure.

The College of Agriculture at Berkeley has again come to the rescue of the dairyman, by offering to put the use of tuberculin in his hands. The test is simple and the University now offers to send a representative to any group of dairymen and give full clinical instruction in the use of tuberculin. It is then intended that this group will in turn instruct their neighbors.

As if this was not enough, the University further will furnish the tuberculin and the chart. They ask that the chart be returned to them to be complied for statistics. Wil. your neighborhood be one of the first to send to the University for an instructor? I hope so. I hope the time will soon come when there are no untested cows in this state.

CONTROLLING TUBERCULOSIS.

The New York station at Geneva, gives the following summary of work done with a tuberculous dairy herd:

1—Tuberculosis is one of the most important diseases of cattle.

2—The Bang method of handling herds affected with this disease has been tried with success in various countries. This method is especially adapted to herds of valuable animals.

3—The method consists of isolating the reacting animals in order to stop the spread of the disease and holding them for breeding purposes.

4—Calves of tuberculous cows are rarely if ever tuberculous at birth. They should be immediately separated from the dam and fed on the milk of healthy cows or on milk which has been properly pasteurized.

5—The milk of tuberculous cows is safe after it has been pasteurized at 185 degrees F. (85 degrees C.).

6—More than one-half of the herd of the New York Agricultural Experiment Station was found to be tuberculous in December, 1900.

7—Quarters were prepared and the application of the Bang method begun in October, 1901, with a total of thirty animals, thirteen of which were healthy and seventeen tuberculous.

8—During four years this herd produced twenty-three desirable heifer calves, approximately one-half coming from the tuberculous animals, and in November, 1905, it contained thirty healthy animals.

Tuberculin tests should be made by competent veterinarians. This disease is more disastrous in the Northern and Eastern sections.

All cows do not like the same kind of food; neither will they do as well as they would on some other kind. Study the wants of the animal.

Go southwest, young women, and let some young ranchman make a home for you! A few quarter sections, all fenced, paid for, and well stocked, help make a happy honeymoon.

WEAK WOOL INHERITED.

Do ewes transmit weak wool to their offspring, or do they simply transmit those physical qualities that are responsible for the presence of weak wool?

It is the writer's belief that the latter is the case. Just as in the human family, consumption proper is not transmitted, but weak and poorly-developed lungs, which render the individual susceptible to the inroads of tubercular germs; just so in the sheep family, weak wool proper is not transmitted, but a weak physical condition which cannot resist exposure or overcome results of unwise treatment.

In the show ring, any breeding ewe that has weak wool is pretty likely to be excluded from the prize awards, and justly so, for she is not so valuable as the ewe that has a good fleece and is equally good as a mother.

However, this act of turning down the ewes with poor fleece is likely to carry with it the implication that the ewe is not desirable as a breeder, whereas, under certain conditions, this does not necessarily follow. If a ewe is functionally strong, has good heart lungs and other vital organs, and has poor fleece simply as a result of being too much exposed to the weather, or some other wholly unavoidable cause, she is just as good for a breeder as any other, for she most certainly will not transmit weak wool to her offspring.

Her own weak wool is not of her personal weakness, but rather of external causes which might have been controlled, but under which she could not hold her own. If her fleece is not strong, she is out of condition and her lamb and fleece this year may not be worth so much as that of a better-conditioned ewe, but she is not incapacitated for future service of a high order if properly cared for. Such a ewe may be bought cheap and good profits made from her.

Howecer, if inspection of the weak-fleeced ewe discloses physical defects and functional weakness, she should be avoided, for she is almost sure to transmit these qualities to her lambs, and they in turn will be an easy prey to those conditions that result in a weak fleece. Some sheep take cold every time a breath of air strikes them, and get out of condition easily. These are the ones whose lambs have weak wool, not because their mother had it, but because they have inherited their mother's tendency to easily get out of condition.

DAIRYING AND FERTILITY.

Lest dairymen forget the important relation between dairying and fertility, as compared with other branches of farming and live stock husbandry, I wish to call attention to some figures recently made public by the Ohio Experiment Station.

According to those figures, when a man sells $2 worth of straw from his farm he sells as much fertility, that is, removes it from the farm, as he would sell in $80 worth of butter. When he sells $18 worth of oats he removes as much fertility from his farm as he would in selling $325 worth of cream. In selling $20 worth of wheat at 80 cents per bushel, he loses as much as though he had sold $290 worth of cream.

Some people will believe an argument like this when you are selling grain or hay from the farm, but they say that there is very little difference in the effect upon fertility whether you keep cows or fatten steers or hogs, or, in fact, practice any branch of live stock husbandry.

The Ohio Experiment Station, however, is authority for saying that when a man sells $100 worth of beef at 5 cents per pound he removes as much fertility as he would in selling $500 worth of butter; also that when he sells $100 worth of pork at 5 cents per pound he sells as much fertility as he would if he sold $360 worth of cream. As a matter of fact, in dairying, in the selling of butter or of cream, very little fertility is removed from the farm. It is estimated that in selling a ton of butter not more than 50 cents worth of plant food is removed from the farm, and, if the butter was absolutely clean and pure, there would be none removed.—Colman's Rural World.

SKIMMING BY DILUTION.

When cold water is poured into fresh milk it dilutes the whole body so that fat globules have a better chance to rise.

Thus the cream more quickly appears and the diluted skim milk looks so blue that one is apt to conclude that the skimming has been very effectual.

The claim for the dilution creamers or "separators" so-called, is that you get the cream sooner than you can by deep setting in the milk can, and that you also get just as much cream as you could with a hand separator, and the cost of an expensive machine is saved.

Let the agent of these water creamers prove their claims in your presence. Let him have part of the milk to skim his way and you skim the rest with a hand separator. In six hours, test the skim milk of each for lost butter fat.

Remember that he diluted the milk with an equal amount of water. Then the skim milk is half water. Also the per cent. of fat found in that skim milk should be doubled, because it is unfair to call water milk. You will find no agent cares to make the comparison.

Skim milk that is half water is not fit to feed. A calf or pig has to drink too much of it to get the proper amount of nourishment. You have a pot-bellied dilution calf. The skim milk from the hand separator is warm and sweet and ideal feed.

The cream does not all rise in six hours, though the watered skim milk appears to have none of it. Better results are obtained by deep setting and waiting twelve or eighteen hours to get the cream.

Cream from dilution separators makes poor butter. Most well water contains bacteria, and some of it contains very bad kinds. These multiply rapidly in milk and impart bad flavors to the butter made from such cream.

In judging the water "separator" "judge not by appearance, but judge righteous judgment."—S. F.

Harry Snyder, Professor of Soils, Minnesota, states that the indirect value of manure is greater than that of a fertilizer. Chemical changes result from the contact of decaying manure with inactive mineral food in the soil, which render it available, besides prodcuing humus. Continuous grain farming uses up humus, making it less capable of holding moisture, and as there is no decay of vegetable matter, the time arrives when the soil must have a long period to recuperate itself.

Is it Purina Chick Food? It must be, it looks so clean and nice. I'm a Checkerboard Chick. See my ad, page 315.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

Great Land Opening in California

President Roosevelt has signed the Special Act of Congress granting our complete irrigation system 45,000 miner's inches of water from the navigable Sacramento River. Free water right; rich, black sediment soil; rail and steamboat transportation. All fruits and vegetables yield enormous returns.

10, 20, and 40 acre lots, from $30 to $100 per acre; terms one-sixth cash, balance in five years. For information and booklet, write **F. E. ROBINSON & CO., 216 P. E. Bldg., Los Angeles, Cal.**

BEDDING FOR COWS.

Liquid manure is worth more than the solid, but it is the part that is usually allowed to be lost. Try to have the cows well bedded, not only for their comfort, but that as much manure can be saved as possible.

The amount of bedding suggested for twenty-four hours by the Maryland Experiment Station is as follows: Cut corn stover, 4 pounds; cut wheat straw, 5 pounds; uncut wheat straw, 5 pounds; sawdust, 12.5 pounds, and shavings, 4.4 pounds.

Assuming a value of $5 per ton for corn stover, $5 per ton for wheat straw, 25 cents per ton for sawdust, and $6 per ton for shavings, the yearly cost for bedding for a cow stabled twenty-four hours is as follows: Cut stover, $3.65; cut wheat straw, $4.82; uncut wheat straw, $4.15; sawdust, 45 cents, and shavings, $4.81. Yet, these are economical to use, for they absorb fully $15 worth of liquid in the course of a year.

BAD TEMPER.

Uncle Silas, in Kimball's Dairy Farmer, hits the bad-tempered man who pounds his cow in a fit of temper, and condemns the same kind of a man who treats his correspondents or associates discourteosuly, when irritated.

He advises such men to follow the advice of President Lincoln in approving the course of Secretary of State Seward, who said he would write a severe letter to an offending official under him. When he had completed this, a work of art in sarcasm and invective, Lincoln advised him to tear it up and write a mild one.

Lincoln's purpose was to give Seward a chance to work off his temper. Uncle Si suggests that ill-tempered people write it down and then tear it up, before saying something to be afterwards regretted.

Publishers' Department

MAKE READY FOR HARVEST.

YOU owe it to yourself to consider in time as to how your crop is to be harvested. A little time given to considering the matter now, will enable you to be fully ready for grain and grass cutting. You should have all of your machines in the best of trim, so you can go to work in dead earnest. Getting ready for harvest is the most important thing after seeding. You can't afford to have things go wrong. Delays on account of breakage are expensive and exasperating. Machines that will not work right because of faulty manufacture are still more exasperating.

It is money in the pocket of farmers to buy the best machines that can be had. Particularly is this true with machines that concern the hay and grain harvest. This naturally calls to mind the Champion, Deering, McCormick, Milwaukee, Osborne, and Plano binders, manufactured by the International Harvester Company. There are a half dozen machines from which to choose. You may be urged to buy one or another, according to the local agent you may happen to deal with. A good many experienced farmers think it makes but little difference which one is selected. It is unquestionably true that no mistake can be made by choosing any one of the six.

They have all been on trial many years. All have been improved wherever improvement has been shown by experience to be possible. The International machines afford a good guarantee, perhaps the best guarantee to be had, that your busy harvest work will go on uninterruptedly, and that you will get all the grain, with little annoyance, and with the saving of all the unnecessary work possible for both man and team.

International agents are to be found almost everywhere. That is an important consideration, particularly when you take into consideration the necessary repairs, which are matters that frequently require most urgent haste, and which the local dealers make it their business to look after.

If you are not fully prepared for the coming harvest, look up one or more of the local International agents in your town, get the catalogues, make a study of them and then talk with the agents about the machines you will need. The agents will have the machines on hand to speak for themselves, and they will be able to answer all your questions.

HORSE ON HER.

"I want two pounds of paralyzed sugar," she began with a business-like air.

"Two tins of condemned milk."

"A bag of fresh salt. Be sure its fresh."

"A pound of desecrated codfish."

"Nothing more, ma'am? We have some nice horseradish, just in."

"No," she said, "it would be of no use; we don't keep a horse."

Life is worth living if we make it so by making it worth living to more unfortunate people.

When a man makes a jackass of himself, he is sure to be ridden.

Of course I like Purina Chick Feed, for I,m a Checkerboard Chick. See my ad, page 315.

THE TILTON APRICOT.

THIS apricot seems peculiarly adapted to Central California conditions and we have many letters from that section that are loud in praises. In apricot growing districts in the state it is a favorite with many, but does not seem to have been as extensively planted as in the country north of the Tehachapi. Reports before us, reaching from Riverside up to Napa, all speak in the highest terms of the fruit, putting it before any other sort.

J. W. Bairstow, Hanford, Cal., is advertising these trees. See his advertisement in Deciduous Department.

ROBBING HIS BOY.

Last spring a farmer found in his flock a lamb which the mother would not own. He gave it to his son, a boy fifteen years old, who saved it and raised it. The boy called it his all summer, all the family called it his, and it was his. But this fall when his father sold his other lambs he let this one go with them, and taking pay for it tucked it into his big wallet and carried it off to pay taxes or put it in the bank.

On this statement of facts the Manchester Mirror makes the following severe but just comment: "Now the farmer did not intend to do anything wrong, least of all did he intend to wrong his boy. Probably he did not give the matter much thought anyway, and if he did, he considered the boy's ownership of the lamb a sort of pleasant fiction, or reasoned that the boy, having all his needs supplied out of the fanily purse, did not need the pay for the lamb, and it was better to put it into the common fund. But for all that taking the lamb and selling it in that way, and pocketing the proceeds, was stealing. No, it was robbery, and, as between this boy and his father, one of the meanest robberies that could be perpetrated. Not only this, but by robbing the boy of that two dollars the father did more to make the boy discontented and drive him away from home than he can undo with ten times that amount.

A boy is a little man, and if he has got any of the gather and grip to him, when he grows up, he begins at an early age to feel that desire to own something, and to add to the property subject to his ownership, which is at once the incentive to effective work and the motive which reconciles men to their condition.

VALUE OF SMALL FARMS.

One of the most serious drawbacks to the development of the vast agricultural districts throughout California lies in the fact that much of the land is in large holdings, running into thousands of acres. Instead of being cultivated to its highest state on extensive ideas this land is given over to grain raising or grazing, and supports, at most, ten people to the thousand acres.

California's opportunities are wonderful, but in order that these opportunities may be taken advantage of to their completeness, it is necessary that every acre of her fertile land be cultivated to its fullest possibility. What may be done in this direction is well exemplified in the vicinity of Modesto where the great Turlock and Modesto irrigation canals have brought thousands of acres under the highest state of cultivation, and where hundreds of homes have been established on land formerly given over to broad and extensive culture. A country that formerly provided for but ten or a dozen people is now occupied by a family on every twenty or forty acres.

PEPPER.

Black and white pepper are from the same round seed of a tropical plant. The white is ground after the black outer skin has been removed. That is the only difference. The white is considered less irritating to the stomach. It is also preferred for dishes consisting of cream and milk, such as oyster stews, creamed potatoes and the like.

Standard Mowers For You

The Ornamental Garden

By ERNEST BRAUNTON

SHADE TREES.

EVERY one has noticed how barren and desolate a home seemed when there were no shade trees, and that, in otherwise well-kept grounds, something was lacking to make the place homelike. On the other hand, how cool and restful and attractively inviting a home seems for having plenty of shade trees scattered over the grounds, particularly when they are supplemented with ornamental shrubs and vines and hedges!

In speaking of shade trees, perhaps the ones more generally thought of than any other are the acacias; and this is not strange, for there are now acacias everywhere throughout our land, including hundreds of varieties, some classified and many unclassified, but all adapted to our soil and climate.

SWEET WILLIAM.

The Sweet William of our gardens is Dianthus barbatus, a member of the pink family. It is one of the oldest of garden flowers; something is wanting if it is not found in the old-fashioned gardens. It possesses many charms endearing itself to all who love the old-time flowers. The blooms are of various colors, exceeding attractive, and the plants are free flowering. The Sweet William is really a perennial, but better results are obtained if it is treated as a biennial. Seed sown in July in the open border will furnish good plants for the folowing season's flowering. In addition to the many beautiful single varieties there are numerous double ones which continue in flower for a longer period. Never let the hardy border be without the dear old Sweet William.

HONEY LOCUST.

The honey locust, (Gleditschia triacanthos) in the forest usually attains a height of from 75 to 100 feet and a diameter of from two to three feet, with a well-proportioned trunk and crown. Under favorable conditions it occasionally reaches a much larger size. In the open it produces a short trunk and a broad, open crown.

The trunk and branches are armed with rigid spines from three to four inches long, which frequently grow in large clusters. These spines are occasionally objectionable, but can be removed by pruning if desired. Many trees are partially or wholly free from spines, and this form is, naturally, most satisfactory for shade purposes.

BORDER VERBENAS.

Where a showy border is desired there are few finer plants than the verbena, especially if the scarlet and the white are used, or the scarlet with the white eye.

In using the verbena it must be kept well in hand and pegged down and trained to grow the way it should or it wil be apt to "possess the earth" and cover everything in sight.

The more freely the flowers are picked— including always a generous amount of them—the more freely they will bloom. Like most of the border plants, the verbena will endure an immense amount of heat and drought.

Stella: "Isn't that Mr. Bachelor kind and gentle?" Bella. "That's just the trouble; he stands without hitching."

FENCE POST TREES.

In planting trees for fence-post production the first and most important requirement is the selection of suitable species. A fence post should be made from wood of moderate strength, able to hold staples well, and durable in contact with the ground.

Numerous trees have these characteristics, but to make a successful plantation and to secure early returns the species chosen should, in addition, be of rapid growth and well adapted to the locality. Nearly all the older forest plantations in the prairie states were made for protective purpose. Rapid-growing species, such as cottonwood and silver maple, were chosen. In many cases they were not adapted to the locality, and failed.

Those plantations which succeeded are now furnishing fuel and some lumber, but not the fence posts the market demands. In more recent years the importance of growing more durable timber has been recognized. A forest plantation may often serve both as wood lot and as a shelterbelt for crops, stock, and farm buildings. If trees suitable for fence posts are grown, they will furnish the desired protection and also yield a salable product.

OUR YELLOW PINE.

The western yellow pine, (P. ponderosa) is a very hardy tree and will endure great diversities of soil and climate. It is especially suitable for planting in dry regions where droughts are not too prolonged.

The conditions under which it usually grows prevent the tree from making a rapid growth. In the most favorable situations, however, its growth is fairly rapid.

Western yellow pine has suffered greatly from the attacks of bark beetles. The trees are usually attacked during August and September and die by the following spring. If a plantation is attacked by these insects, specimens, with description of the damage, should be sent to the Bureau of Entomology, Department of Agriculture.

Because of their long and heavy foliage, the young trees are sometimes borne down by deep snows.

The wood, which is light, strong, dense, and moderately durable, is the most valuable one of the Rocky Mountains and the most extensively used. Because of its dense foliage and ability to grow in close stands, the tree forms an excellent watershed cover.

"Gimmee some 'lasses, Sam."

"You musn't say 'lasses, "You must say molasses."

"What is you talkin' 'bout?" "How's I gwine to say mo' 'lasses when I ain't had none yet?"

One woman writes: "My husband disappeared three years ago. Please locate him among the killed at San Francisco, if possible."

Woman is a strange and puzzling creature, who is always giving new perplexities to man. Woman makes you think she thinks what she doesn't think, and the best thing to do is to think she doesn't think what she seems to think.

The Vegetable Garden

By ERNEST BRAUNTON

THE AVERAGE GARDEN.

A VERY large majority of the homes throughout California, whether, urban or rural, have near at hand an inclosure called "the garden." As spring approaches last year's growth of weeds are piled and burned, the surface of the soil stirred, and potatoes, peas, corn, beans, onion sets and tomatoes are planted.

When these are in danger of being crowded out by weeds they are cultivated. As the time for them to reach edible maturity approaches, cultivation ceases, weeds take possession and hold undisputed sway until the following spring, unless a portion of them are plowed and turnips broadcasted for early spring "greens."

As a consequence of the practice, only vegetables inferior both in quality and quantity are produced, discouragement follows and the garden is abandoned or converted into a calf pasture.

This is no pen picture of the imagination, but a statement of actual conditions common in this and other states. It is true, however, that there is an occasional well kept garden, yielding in variety and abundance throughout the greater portion if not all of the year. While all are lavish in their praise of such a garden, it rarely occurs to them that they might read the object lesson and follow the example. There is no reason why the California vegetable garden may not be made to yield every month in the year.

SEEDS AND SEED SOWING.

There is no point in horticulture in which so great an improvement has been made in this country as in the quality of the seeds offered for sale to the gardener. The art of seed-growing is better understood, and the requirements of our climate have been studied by practical men.

The writer can well remember when dealers prided themselves that the seeds they offered were "English" seeds, not knowing that with many plants American-grown, and more especially California-grown seeds, are infinitely superior for our use.

In the days of the old "Early York" cabbage we remember with how much of uncertainty the seed were sown, not knowing whether any of them would make a solid head. And not until the "Early Jersey Wakefield" cabbage was developed from the English Wakefield, by continuous selection in our climate, did growers fully realize that for certainty of crop it was necessary that cabbage seed for American use must be grown in America.

The question of climate in its relation to production has been more closely studied of late years, and no well-informed gardener now supposes that all the seeds he needs can best be grown in one climate, though California is well to the fore. There are many seeds that do not reach their best development as crop-producers in the east, in any given locality, when they are grown far north or south of the latitude where they are to be sown. But this does not apply to our state. While the market gardener can seldom afford to grow his own seed, there are many which he can generally produce to advantage, if unable to get them from a reliable grower in his own latitude and elevation, for elevation above the sea as a rule, has the same effect on many crops as a high latitude.

CHANGED CONDITIONS.

Until within comparatively recent times the introduction of foreign species worthy of cultivation in this country was largely confined to horticulturists, who maintained private fruit gardens or nurseries.

In fact, prevous to the establishment of the state experiment stations by Congress, in 1887, an important function of the work of the nurseryman was the introduction and testing of new sorts, both of foreign and domestic origin. While the commercial dissemination and popularization of fruits is at present almost exclusively in the hands of the nurseryman, the introduction of foreign species and varieties, as well as the testing of both foreign and domestic sorts, has fallen largely into the hands of the Department of Agriculture and the experiment stations.

The general perspective of fruit culture in America has been greatly changed during the last twenty-five years, and many of the lines of work carried on in private fruit gardens have been absorbed wholly or in part by other forces; yet the profitable occupation of fruit growing is ever open to the amateur, to say nothing of the highly interesting work of plant breeding.

MELON DISEASES.

Several diseases attack the leaves of cucumbers and melons in this country. Downy mildew, leaf-blight and anthracnose are the most common, though there are several others of less importance. The parasitic fungi which cause these troubles are quite distinct in their nature, but produce rather similar effects on the foliage.

From the standpoint of the farmer they may be considered together, since the treatment for all is practically the same. It is well to know their exact characters, however, especially since there are a number of other maladies, due to bacteria, soil and climatic conditions, and to insects, which do not yield so readily to spraying, and may be confused with the disease to be described.

AMATEUR FRUIT GROWERS.

The testing of varieties in new localities and the development and dissemination of new sorts by the amateur is an important work, but the greatest good accomplished by him is to be found in the wholesome influence which he exerts on the community in which he lives.

A community is certain to profit aesthetically as well as financially from the influence of such growers, and it is to them that we owe our appreciation for high quality. A discriminating taste developed in a neighborhood creates a demand which it pays well to gratify, and the amateur who grows fruits for quality will find a ready market in such a section.

You'd better see my ad, page 315, for I'm a spunky little Checkerboard Chick.

Seeds Plants Fruit Trees.
Most complete stock in the West, embracing everything new of decided merit in both vegetable and flower seeds. Headquarters for Eucalyptus and other tree seeds. Full line of Fruit Trees and Ornamental Stock. ***Write for Our 1907 Catalogue.***
Poultry and Stock Foods
We carry the most meritorious foods on the market, many being recommended by the U.S. Experiment Stations as containing the highest percentage of protein, which is the principal factor in egg production. ***Write for Our New Poultry Catalogue.***

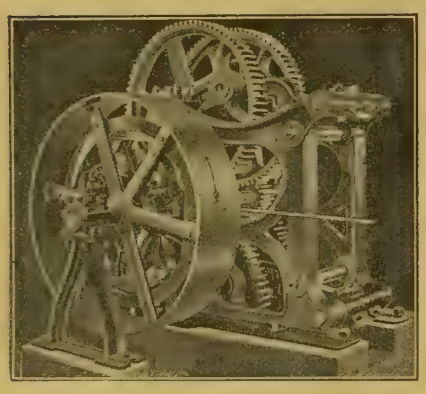
At bottom prices. All first-class and from the cas best spring. G. W. Mullendore, Covina, Cal.

The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Irrigation and Pumping

IRRIGATION IN CALIFORNIA.

IRRIGATION should be recognized as an agricultural art of very wide applicability and value. Its association with the idea of desert reclamation has blinded the public mind to its value for regions where the need of reclamation does not exist. Irrigation is a means of soil improvement to be employed, like other means of improvement, when the soil needs it.

Water is the most important food of plants, not alone because it enters in such volume into their tissues, but because without it in adequate amount the plant cannot use other foods in sufficient quantity. No one questions the wisdom of the saving and storing of manures, nor the wisdom of generous outlay for commercial fertilizers when required. The same is true of soil improvement by means of drainage. There should be a similar feeling in regard to irrigation.

The most diligent culture and the most generous fertilization are often made of no avail, and actual loss is sometimes incurred, because the farmer has not prepared himself to supply water when needed. The water, which he could often provide for a mere fraction of his expenditure for fertilizers, often for less annaul cost than the interest on his investment in underdrainage, he has neglected to have ready for use, and he sees the hope of return for his year's labor and expenditure fade away during a few weeks of drought.

There have been cases where water has been stored at considerable expense as a protection against fire in barns and has remained unused while some valuable crop was burning up in the garden. Such losses are largely due to two things: First, the notion that irrigation is of importance only in arid regions; and, second; ignorance of the ease and cheapness with which a farm water supply can be stored and distributed. It is very important that the value and availability of water for irrigation should be recognized and a supply provided on each farm.

Irrigation, moreover, is not merely a recourse to insure the safety of a crop. It has been demonstrated beyond question both by practical experience and by systematic experiment that growth and production can be profitably pushed by irrigation even when the natural moisture seems ample, and in this respect irrigation aligns itself with fertilization and cultivation as a factor in intensive culture.

Another error grows out of the large scale upon which irrigation is generally known to be carried on, involving canals and ditches too expensive for individual undertaking. The impression is made that considerable capital and engineering skill are necessary to success; but as a matter of fact profitable irrigation is easily attainable by small effort.

It lends itself readily to small individual or co-operative undertaking, developing water whose presence may be almost unsuspected, or utilizing water which ordinarily is either wasted or is a positive detriment when not turned to profitable service. It is the purpose of this bulletin to present suggestions for irrigation of this kind.

Small irrigation works usually require neither greater skill, labor nor outlay than other farm improvements which are readily undertaken. They do not require as exact engineering as underdrainage by tiling, and the whole system, both for development and storage of water, often costs much less per acre of the area irrigated than does tiling.

The work is more readily comparable to the construction of open drains, coupled in some cases with reservoir building, which is no more difficult than cellar excavation and is accomplished with a similar outfit of teams, plows, and scrapers. The man of ordinary skill in handling these tools, who can turn a straight furrow, or build a straight piece of fence, and can do these things well, needs only a suggestion of the feasibility of securing a home water supply for irrigation, providing his conditions are favorable.

The first thing to be done in all cases is to make a careful study of the whole situation, the location of the water supply, the lay of the land, and its requirements of water, etc.—Prof. E. J. Wickson.

RELATION OF SOIL.

The desirability or irrigation is unquestionably, in many cases, conditional upon soil depth and character. This relation has received careful attention from soil physicists, and, although an understanding of it involves problems of plant growth and the movement of water in soils, the leading facts are available in popular form.

An examination of the data in the table shows the prevalence of irrigation in localities where fruits are grown on light loams, whether the soils have resulted from local disintegration of rocks or have been transported to their present locations. This is merely wider proof of the fact of ordinary observation that, other things being equal, the coarser and less retentive the soil the greater the necessity for irrigation; but the fact is strikingly presented in a number of cases. One grower at The Dalles, Ore., is located on an upland loam, dark brown, formed of decomposed basalt at the base of slopes from ten to fifty feet in depth—a soil holding moisture well and producing fruits without irrigation. Another grower has reclaimed a sand flat along the Columbia river by irrigation, and is growing tree fruits profitably on land which originally was hardly worth $1 an acre, but which his work has made worth one hundred times that amount. Here the character of the soil was an important factor in determining the necessity for irrigation. Another striking contrast is shown in four neighboring localities in the Sacramento valley, California. Elevation, rainfall and exposure are similar, yet in two cases irrigation is practiced and in two it is not. The explanation here is the occurence in the two irrigated districts of an impervious hardpan, locally called "bedrock,' which is so near the surface that the shallow layer of soil cannot retain moisture enough to maintain growth and fruiting in the dry season.

Hurrah for me! I am a Checkerboard Chick. See my ad, page 315.

I put MACBETH—my name—on every lamp-chimney I make.

If I did not make as good chimneys as I do—and did not have the confidence in them that I have—I would send them out as most other makers do—unmarked.

My Index tells of lamps and their chimneys, fully and interestingly. Let me send it to you—it's free.

Address, MACBETH, Pittsburgh.

Gold Medal Citrus Trees

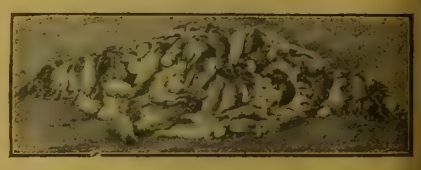
Are fully described in our treatise of Citrus Culture, which is a trifle the best thing of its kind ever published. Contains about 50,000 words and 100 illustrations telling about oranges and lemons from the seed bed to the bearing orchard. Price 25 cents. Remember we are the largest producers of Citrus Trees in the world and stand ready to serve you with the finest nursery stock that can be grown. Correspondence invited.

San Dimas Citrus Nurseries

San Dimas, Cal.

R. M. Teague, Prop.

Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us.

We do not send less than 2 bottles.

Compounded under Bille's patent by

West Coast Stock Food Co.

818 San Fernando St., Los Angeles, Cal.

Eggs for Hatching

Thoroughbred White Rock eggs for hatching at $1.50 for 15, $6 per hundred.

Mammoth Bronze Turkey eggs, 20 cents each.

CROP REQUIREMENTS.

It is not very generally understood how large an amount of water is required for the production even of fair crops; for the maximum of possible product is rarely obtained on the large scale, because it is not often that all conditions are at their best at any one time and locality. But from numerous observations, made both in Europe and in the eastern United States, it has been found that from 300 to over 500 tons of water are on the average required to produce one ton of dry vegetable matter. In Wisconsin, King found that a two-ton crop of oat hay required over one thousand tons of water per acre, equal to about nine inches of rainfall. The average rate for field crops at large is given by European observers at 325 times the weight of dry matter produced, being at the rate of about three inches of rainfall actually evaporated through the plant.

These data should enable us to estimate the adequacy of the moisture contained in the soil at the beginning of the dry season to mature the crop, provided we make due allowance for any growth already made at the time, and provided also that the estimates as to the water-requirements derived from the experience of the countries of summer rains (the humid regions) hold good for the arid region also.

ELEVATION AND EXPOSURE.

It is clear that elevation does not alone determine the necessity for irrigation. The table shows it to be practiced from twenty feet above sea level on the Coast plain of Orange county, Cal., to 5000 feet above sea level in Inyo county, Cal., and in southeastern Idaho. Nor is height above local river bottoms a ruling factor, for it is resorted to both on river bottoms and several hundred feet above them on the slopes of adjacent foothills. The same is true of exposure. The table shows irrigation on all slopes and on lands practically flat. Both exposure and elevation are local factors of some moment, however, when they coincide with other conditions, as will be shown later.

The first turbine steamship ever built in the United States was launched at the Roach shipyard at Chester, Pa., in April last. It was christened the "Governor Cobb" and will ply between Boston and New Brunswick. It is 290 feet long and contains 175 staterooms.

"Why can't I get my number?" demanded the man.

"Line's busy," replied the telephone girl.

"I don't believe it."

"Its so, just the same. Some cowboys have borrowed it to hang a horse thief with."

Applicant—"I see you advertised for a janitor, sir. I am a married man—no children; neat, honest, patient and tactful!"

Agent—"I regret to say you would hardly do for a janitor, my friend, but wait. Couldn't I get you as a tenant?"

Mistress—Idon't want you to have so much company. You have more callers in a day than I have in a week.

Domestic—Well, mum, perhaps if you'd try to be a little more agreeable you'd have as many friends as I have.

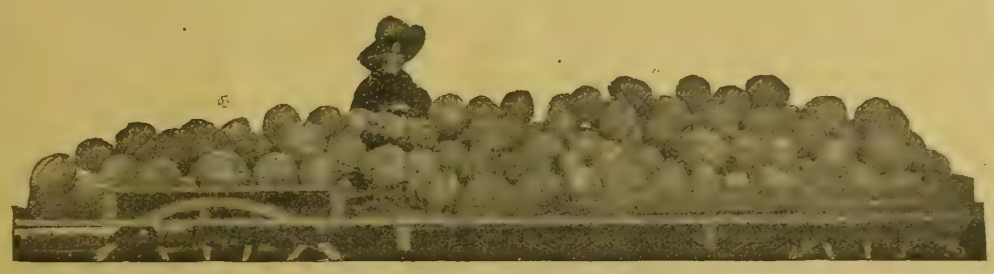
"The hen that lays is the hen that pays."

The New Melon

HAS BEEN NAMED THE

J. & M. Christmas Melon

By Charles Richardson, of San Gabriel, Cal., who was awarded the $5.00 offered by Johnson & Musser Seed Co. for the best name for the New Melon. **Price—Per oz., $2; per pkt., 50c.** Sold only by Johnson & Musser Seed Co.



The Most Popular Musk Melon on the Los Angeles Market. For Two Years

Gautier's Pineapple Musk Melon

Has eclipsed all other varieties to such an extent that ninety per cent of all the musk melons grown for the Los Angeles market are of this variety. **Price per lb., $1.00.** Sold only by Johnson & Musser Seed Co.

Oregon Evergreen Sweet Corn

Last year was the first season this excellent sweet corn was grown extensively for the market, with the result that the newspapers commented upon the unusual excellence of the sweet corn offered by the peddlars. No market gardener will now grow any other variety because Oregon Evergreen Sweet Corn will yield nearly double the crop of any other variety, is less liable to the ravages of the worm and, once having tasted this, the consumer will have no other. **Price—Per lb., 15c; per 100 lbs., $8.00.** Sold only by Johnson & Musser Seed Co.

Eastern Grown Field Corn

We have just received our usual carload of seed corn from Nebraska. It is extra selected and hand-picked. Send for samples of the varieties you wish to plant. Why plant common seed when 25c worth of our extra selected hand-picked Eastern corn will plant one acre. **Price—Per lb., 5c; per 100 lbs., $3.50.** When ordering corn seed to be sent by mail, add ten cents per pound for postage.

Anaheim Chili

Nearly ten inches long

In this chili Southern California should feel a personal pride. It is of local origin, and as we are always on the lookout for the best of everything we discovered this excellent pepper, already popular in the Anaheim section, but little known elsewhere. We now buy the peppers and take the seed from them, so we are enabled to positively guarantee our seed true to name and the best of its kind. **Price—Per kpt., 25c; oz., 25c; per lb., $2.50.** Sold only by Johnson & Musser Seed Co.

BEES AND THEIR CARE—Bees and Fruit Growing, 326.

COUNTRY LIFE.

All parents in the country should teach the boys and girls to be proud of their homes. The country schools are, in many cases, better than city ones with multitudes of studies, for they teach freedom of thought and independence in study that are unknown in the great city machinery of the public schools.

The country churches may lack some of the eloquence and musical frills of the city organizations, but they are still doing good work and need all the help and encouragement it is possible to give them. With trolley lines, telephones, good roads, free delivery and comfortable carriages, the country people are better off today than ever before in the history of the nation.

If only the inhabitants of the farms could know how many agricultural papers are taken by city people and how the men and women shut up in stores and factories long for the fresh air and sunlight of the country, they would learn something of the advantages of their own homes.

LEMON STUDENT HERE.

Dr. Rodney H. True of the United States Department of Agriculture is here to study the character of our lemons, with headquarters at Riverside. He is pursuing his work most quietly and few know of his presence. He only expects to do what might be termed foundation work, this season, but next season hopes to take up practical demonstration. Mr. J. H. Reed writes that he believes his coming will prove as much of an era in the lemon industry as has Mr. Powell's work with the orange. If this proves true it will mean hundreds of thousands of dollars annually put into the pockets of our lemon growers.

RATHER COMPLEX.

Mr. E. D. Taylor, editor of the Hollywood Citizen, is becoming a student of the dairy cow. Under date of March 14th, he propounds to the Cultivator a series of academic questions which we confess puzzle us not a little, to return satisfactory replies.

We quote his letter: "My heifer is of a brunette complexion and sunny temperament. She was for a year a boarder in a 500-acre pasture over in Lankershim. Half of this pasture was straight up hill and the other half was straight down hill and in reaching for the elusive herbage the heifer became delicately etherealized and unduly active. I desire to obtain some information. During the intermittent ceremony of milking, the heifer poises herself gracefully on two or three limbs, and waves her remaining members around in the air. I should like to inquire whether this habit is sporadic or endemic? It interferes so seriously with that steadiness, which is the most admirable quality in a milk-pail, as to be really quite undesirable. Likewise she has an inordinate ambition to occupy the same space in the stall, which I am striving to occupy myself. This you will understand is impossible; any fool can see that and it leads to complications. Also she pays no more attention to a stake than a pupil in the first reader does to a period. When staked out and wanting a change of scene, she walks off with the stake and so much of Southern California as adheres to it. Then she goes calling among the neighbors and is not, I am free to confess, a social success. There is no lack of warmth or enthusiam, so far as I can see, in the reception given to her, but there is to be detected an absence of cordiality. It is my desire so to train this young creature that she may be elevating in her influence on those who come in contact with her, and at the same time add to the beauty of the landscape. Possibly you can give me some suggestions. If you are able to balance an old-fashioned clothes rack on one corner and whirl is rapidly it will give you a reasonably clear idea of the central motive of the theme to be elaborated. Failing of advice then could you call the attention of your bovine department to the matter?

"Thanking you in advance for your kindly help, I am,

"Yours Very Sincerely,
"E. D. TAYLOR."

It is difficult, with the data at hand, to diagnose the case of your cow with certainty. The fact that she is a brunette is against her steadiness of demeanor, for physiologists tell us that brunettes are of a more nervous disposition than blondes and more easily affected by uneven conditions. If her milker is possessed of a mild and forgiving disposition, one which bears affront (a kick) with unruffled temper, it is possible, in time, the heifer may be domesticated sufficiently to permit of affectionate handling. It is possible you are too dextrous with the milking stool. We would suggest that you use it for the purpose for which it was originally designed. The cow doubtless will be better satisfied and therefore more docile.

The fact that the pasture she has been wont to graze in is so abrupt, may have something to do with her desire to "be up in the air" so frequently. She has been educated that way. The habit doubtless, is neither "sporadic or epidemic," but generic.

Her desire "to occupy the same space in the stall" with you shows that she is of an affectionate temperament. We would advise you to cultivate that disposition, but at a respectful distance, at first, in obedience to the well-known law that "two bodies cannot occupy the same space at the same time"—without inconvenience to the weaker of the two. This suggestion is offered in the interest of hygiene. As to her utter disregard of the controlling virtues of the stake, you might give her a rudimentary lesson in discipline by tying the rope around yourself and giving her the advantage of field exercise, being sure that your legs are in proper length proportionate to those of the heifer. The exercise, by the way, might be beneficial for both. The experience will certainly not go for naught in your own case at least, as we feel sure that it will give you an intimate botanical knowledge of grass roots and things.

BACK TO THE SOIL.

Scarcely an agricultural paper printed in America today that is not advocating the doctrine of putting boys and girls on the farm for industrial and physical training.

The argument is based on two grounds, viz: The necessity for manual training among the boys and girls, which they do not get in town, and the importance of a practical education along lines promotive of intellectual broadening.

The age in which we live is purely a commercial one, and the health of the body has been neglected to such a degree that the present generation of children is affected physically, we mean the physical body has been neglected for the acquisition of wealth.

The second argument is that our towns and cities are becoming congested, over populated, especially in the manufacturing and mercantile centers. In Great Britain and France, statesmen are giving this subject careful consideration, and the opinions they express is that the future condition of the world points to a serious problem as to what shall be done with the youth in providing means to obtain a living. These economists, who are statesmen, figure that with a period so short as the life of the present generation the end of manufacturing growth will be reached in the glutting of the world's market through overproduction.

One authority states, "that already Europe faces a 'yellow peril' in the industrial competition of Asiatic races, which may be as disastrous to European manufacturing supremacy as a war. That the attractions of the cities draw the rural population as does a brilliant flame the moths—the end, destruction."

In France leading members of the government are described as being especially active in measures for holding the rural population to the farms, by making country life more attractive, by improving the rural public schools and by encouraging the formation of co-operative societies among the farmers, for cheapening transportation, economizing labor and securing from the middlemen for the producer a larger share of the profits on his products.

A writer in the Boston Transcript regards this co-operative movement as "the most important of all instrumentalities at work to keep population 'on the land.' The societies in 1903 numbered 600,000 members, and their successes were marked."

"In Great Britain, John Burns, as president of the Local Government," says the same writer, "is making strenuous efforts for the relief of the congested population of cities. The sympathy of the Liberal party is with him, and the ministry is endeavoring to pass a measure for the benefit of tenant farmers, which in effect proclaims 'that the farmer and his men, the bone and sinew of the rural regions of the country, should no longer be forced to live on the sufferance of great landlords whose idea of their land is that it is primarily intended for their sport." Lord Carrington, speaking for the ministry, recently declared that the great object and ambition of the Government is that it "shall not come to an end without having done something to get the people back to the land, two or three or four back to the land where at present there is only one." And the prime minister declares that the land must become "less the pleasure ground of the rich, and more the treasure house of the nation."

REMOVAL OF THE CAPITOL.

The proposition to move the State Capitol from Sacramento to Berkeley is to be submitted to a vote of the people. The legislature has so decided and the governor has signed the bill.

The next proposition, we suppose, will be to divide the state. The question is now being discussed quite generally and may assume definite form before the next legislature convenes.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

12.79 is Springville's rain record.

Oxnard has had 17.41 inches of rain.

Redlands' rain record to this time tallies 20.51.

The rain to date registers 16.07 inches at Corona.

At Las Posas 20.61 inches of rain has fallen to date.

Riverside has had 13.83 inches of rain so far this season.

The Chino Land Company reports sales of land to 17 new buyers last week.

The barley harvest began at Imperial last week—what section can beat it?

John Corwin has planted 50 acres of grapes and 50 acres of asparagus at Imperial.

At Chino.—J. B. Garat has got in 800 acres of grain and J. H. Creider about the same.

C. H. Willard of Santa Paula had 14 acres of orchard land washed away by rise of the river.

A heavy rain fell at Chino Monday night, dropping 1.55 inches by the S. P. guage. Total fall to date 23.47.

The rainfall for the last storm at San Fernando, amounted to 3.12, making a total of 21 for the season.

The Government rain guage at Sunland, in the San Fernando valley, has so far registered 24.57 inches for the season.

Coachella valley alfalfa hay yields from eight to ten tons per acre. Sells in the valley from $8 to $14 per ton.

Coachella shipped a full car of cabbage for which the growers received 90 cents a hundred pounds hauled to the platform.

Since the last report Coachella has shipped two more carloads of cabbage for which almost phenomanal prices were obtained.

The express shipments for the week were 164 cases of eggs, 1105 pounds of chickens, 1980 of cream and 515 of butter from Escondido.

Yesterday there went from Santa Ana to Los Angeles, 73,800 eggs. This one day's shipment of hen fruit brought the chicken people of this vicinity $1100.

A. T. Mann at Thermal shipped another hundred turkeys to Los Angeles this week, and will ship two hundred more next week and the week after.

James G. Cortelyou of Imperial sold thirty head of fat hogs for $7.35 per 100 pounds, this being the highest price yet paid for hogs in the valley and indicating a steady upward tendency in price.

A new outbreak of Texas fever in Riverside county is reported by Dr. W. C. Rayen, county veterinarian, who has discovered about three hundred head of infected cattle near Rincon, close to the San Bernardino county line.

The railroad surveyors are quite busy in the Yucaipe and Oak Glen country, and when the road is built that part of the country will have quite a boom. A townsite is being laid out at Oak Glen, which has been quite a summer resort for a number of years.

The price of milk and cream has been materially advanced all over the country. Nobody any longer attributes the raise to the manipulation of trusts. It's a simple case of too many people and too few cows.—S. F. Chronicle.

Herman Horneman, in Dairy Produce, remarks: "Patron, give the creameryman a square deal and be ashamed to catch yourself kicking. When your test goes down reason a little. If your neighbor is getting a higher test than you and you feel dissatisfied, why, bless your heart, turn that cream screw, or clean out the cream or skim milk outlet."

HORTICULTURE.

Fallbrook has had 19.35 inches of rain for the season.

Nine thousand acres of beets will be planted about Chino.

San Fernando has shipped 35 cars of oranges this season.

Redlands has shipped 1539 cars of oranges to date and half a car of odd boxes.

Merriman & Tetley have planted two carloads of grape cuttings in the Imperial valley.

There have 13 cars of fruit gone East from Rialto this week, beside five cars for local consumption.

The theory of the rapid decline of Salton sea is being verified, it having fallen seven inches to date.

The output of citrus fruit from Ontario district is much greater than at first estimated by a good many cars.

Ontario citrus shipments for the last month were 200 cars, and at present prices the record will exceed these figures the present month.

The reduction of 10 cents per 100 pounds in the freight rate will mean about $50,000 to the orange growers of the Model Colony.—Upland News.

Ranchers on the Chino lands are setting out quite an acreage to English walnuts this season. This is an unusual occurence in San Bernardino county, as it has practically no walnut orchards.

The rabbit drive Sunday at Stalder, near Riverside, was a complete success and resulted in the death of nearly a thousand of the animals which are such a nuisance to the young orchards, doing a great amount of damage to the trees.

HOPS IN CALIFORNIA.

In some respects methods of hop culture are the same the world over, but owing to peculiar characteristics of soil and climate a system which would work well in England, on the countinent of Europe, or in New York state, would not succeed on the Pacific coast.

So severe has become the competition in hop culture, as in all other branches of agricultural inudustry, that the producer to be successful must be ever on the alert to apply the best and most modern methods.

The last few years have seen some of the best hop yards on the Pacific Coast sold out under mortgage on account of unrenumerative prices, unskillful production, and unbusinesslike methods. There is not a hop grower on this coast, unless it be one who has a large bank account which he can afford to reduce rapidly, who can stay in hop culture using the methods which were in vogue twenty-five or thirty years ago.

Professor Davenport of Illinois gives his opinion that dairy husbandry represents the most intensive form of agriculture practiced on this side of the water, and that we have not settled down to the development of the industry yet. The individual dairyman has his attention too exclusively fixed upon his personal affairs, and too little upon the industry he represents.

"Young man, make your name worth something. If you can sell a hat for $1 you can sell it for $2 if you stamp it with your name and make the public feel that your name stands for something."—Andrew Carnegie.

If the mare is to foal early, before grass time, give her a few boiled oats, and a liberal supply of bran with a little flaxseed occasionally. If she is getting plenty of grass, nothing of this kind will be needed.

Northern California

AGRICULTURE.

Lindsay has had 11.61 inches of rain.

For the fourth time Orosi is flooded this season.

Sheep shearing has commenced at the Kings river bridge and about 120,000 head will be clipped.

The stockholders of the Porterville creamery met on Saturday afternoon last and perfected the organization of the corporation.

The people of Tipton came to gether last night and formed a cooperative, or rather Rochdale Creamery Association.

It rained 4.06 inches during the week at Lockwood, making a total of 19.95 inches for the season's rainfall to date.

The directors of the State Agriculture Society at Sacramento decided to begin the state fair on the 9th day of next September.

There will be at least 1000 acres of land in the Lockwood valley that will not be seeded this year on account of the excess of rain.

The registered Holstein. Friesian Cow Western Duchess Bessie, was sold by Chas. D. Pierce to Wm. H. Crocker, San Francisco.

L. P. Denney has sold five cars of cattle off his ranch near Corcoran. Among the lot were two Angus steers less than 1 year old that weighed 910 pounds each.

Tulare lake is now 11 feet and 11 inches deep in its deepest place, or within four inches of where it was on August 12th last, when it was at its maximum depth last year.

H. J. Ostrander says the increase in sheep this year has been 100 per cent. The season is very favorable for lambs—the weather mild and the feed abundant.—Merced Sun.

The examination of soils by the United States Department of Agriculture bureau of soils, which was asked for by the Colusa Chamber of Commerce, has been started in Colusa county.

The rainfall in Redding for the twenty-four hours ending at 7 o'clock Thursday morning was 0.40 inches. This makes the season's precipitation 28.48 inches, against 22.37 at even date last season.

Hatfield, the rainmaker, has received the balance of his money from the Crows Landing farmers and has suspended operations for the present, as the required 12 inches of rain has been produced.—Madera Mercury.

Every clear day over one hundred acres of sugar beets are planted on the company farm of the Alta California Sugar Company near Chico. Already 1575 acres have been plowed and 500 acres have been seeded to beets.

Beet seeding around Hamilton is progressing rapidly now that the fine weather has set in. Fifty-seven ten-mule teams are at work plowing, followed by another army of men and teams harrowing and leveling. Behind these come the seeders.

It is estimated that about one hundred acres daily are being seeded to beets at Hamilton. At Woodland and Gridley, where the sugar company has a large acreage, the same active work is reported, and at Chico there are a number of farmers planting small acreages.

The following registered Holstein bulls changed hands last week:—De Gracfschop, The Leland Stanford, Jr., University to P. J. Van Loben Sels, Vorden; Gelderland, The Leland Stanford, Jr., University to P. J. Van Loben Sels, Vorden; Helena Burke Korndyke of Riverside, Chas. D. Pierce to J. L. Kinnear, Newman; Ideal De Lone, J. F. Rouch to O. F. Smith, Hanford; Maud Moole Prince of Riverside, Chas. D. Pierce to J. H. Harlan Co., Woodland; Paul Revere Konigen, Walter Mitchel to L. M. Howell, Visalia; Victor Hugo of La Siesta, J. H. Frazell to Est. J. C. Zuck, Gilroy.

HORTICULTURE.

Bonnie Brae has received 13 inches of rain to date.

Rain for the season as Exeter registers just a foot.

Dinuba's rainfall to Marsh 12, was 12.67, against 9.10 lest year.

The prospects about Yuba City are good for a fine crop of stone fruits.

The almond crop of Sutter county will be much lessened by rain and frost.

San Benito has had 16.77 inches of rain to date, 10.93 was last year's record.

A scheme is on foot to drain 6000 acres of Bear river bottom lands near Wheatland.

Yuba City's rainfall for the season is 21.34 inches, against 14.28 to a corresponding date last season.

The best equipped packing house in the San Joaquin valley is now in course of construction in Dinuba.

Corning has 16.35 inches of rain for the season, against 14.65 inches for the corresponding date last year.

The rainfall for the season up to Saturday noon for Soledad has been 11.38 inches, same date last year, 6.21.

Pruning about Olinda is well under way and with a few days of good weather most of the growers will finish the work.

According to the "Pajaronian," Watsonville's total rainfall to date is 31.15 inches, while the Boulder Creek Echo's report is 31.95.

Z. T. Stroup, William Pinnegar, J. J. Silva and Lamiman brothers, near Olinda, are making quite an extensive planting of peach trees on their places.

The rainfall measured on the government gauge at Salinas seventeen-hundredths of an inch for last storm, making 19.93 inches for the season.

The first car of California grapefruit to arrive in Boston in this season and probably the first to be shipped from the coast left Lemon Cove, California, on February 3.

James Hopkins shipped 50,000 Melindat strawberry plants to Sargen Station for the P. W. Morse Co. This company will add fifty acres to their strawberry area at Sargent's this spring.

Most varieties of peaches are now in bloom and pear trees are just breaking the fruit buds and from present indications there will be a bountiful crop of all kinds of fruit in the Olinda section.

J. E. Viney, from Lemoore, reports considerable development work on the Empire ranch. There is a large company of Japs employed there in planting a tract of 700 acres to vines for the Italian-Swiss colony.

Messrs. Merrill & Vosburg have purchased from John H. Williams one of the largest orange orchards in the foothills near Porterville. There are 150 acres in the grove and the price paid was $750 an acre.

R. C. Merryman, owner of the famous Donnie Brae orange orchards, has begun the laborious task of transplanting some seventy acres of five-year-old orange trees to a higher and frostless belt, says the Exeter Sun.

G. D. Barber, of Olinda, will set out 15,000 grape cuttings of the Emperor variety. This variety of grapes has become very popular on account of the heavy yield and profitable prices received in the Eastern market for the fruit.

A manufacturer of apple wrappers in Seattle has recently taken orders for ten cars of the small squares which are used to wrap apples before packing them for shipment. This indicates that the largest crop ever gathered is expected this fall.

The man who farms by irrigation bets on a sure thing. And it is not gambling, either.

PRESERVING EGGS.

THE price of eggs has dropped to the great delight of housekeepers and the hens are doing their best, a sure sign that eggs are very plentiful and we may have two apiece for breakfast.

From away off in beautiful Shasta county comes the following letter and as I feel sure a reply to it will interest many I will take it as the subject of our chat today. I am more willing to do so as I have had most excellent success for the last four years, every year, preserving my surplus eggs for fall and winter use.

Pertinent Questions.

"I take the liberty of addressing you as I am a subscriber to the Cultivator and of course very much interested in your talks on poultry matters, as I am just trying to make a start in the business."

"The main point now is can we preserve eggs satisfactorily so as to obtain a little better pay for our work?"

"I have heard that you have had good success with silicate of soda or water-glass."

"Did you use a dry powder or the solution? And would you have any objection to letting us know of whom you purchased?"

"I had a small sample sent by the Acme Egg Preserving Company, of Chicago, in powder form but I have been unable to hear from them since last September. A reply in the Cultivator will be appreciated."

Last year I also received a letter in Los Angeles county on the same subject. It read:

"I bought from our local druggist a bottle, less than a pint of silicate of soda. It was a colorless liquid, very thick, and had a musty smell. Believing it to be old and fearing the eggs would absorb the musty flavor I feared to use it, I therefore went to a city drug store and bought some. It was no thicker than water and a dark color, almost like coffee but has no musty smell. These were both called "silicate of soda" but are so different that I do not know which is the right one to use."

Water-Glass is Variable.

This touches at once the most difficult point probably in the use of water-glass for preserving eggs, namely, its tendency to vary in quality. As a matter of fact there are two or three kinds of water-glass, and in addition to the fact that the buyer does not always have a distinct idea as to what he wants, the local druggist may not know all about it, or he may not know which kind is best for preservative purposes. The main use of these preparations for years has been the rendering of fabrics non-inflammable.

The Royal Theater of Munich, was rendered fire-proof by its use as a varnish in the frescoe work, woodwork, scenery and curtains. It is also used for hardening stone and protecting it from the action of the weather. It was thus used many years ago, to arrest the decay of the stones in the British Houses of Parliament.

The use of this medium for egg preservation is comparatively new, especially in this country, and it is not to be wondered at that dealers do not always supply just what is wanted.

What Water-Glass is.

If we used the term soluble glass or "dissolved glass" in reference to either water-glass or silicate of soda, it might better describe just what we want, although one of the other names might be preferable when ordering of the druggist. For this term expresses exactly what the material is.

When we buy it by the pint or quart we get dissolved glass. When we buy it dry, we get a soluble glass powder, sometimes like powdered stone, sometimes white and glassy as to its particles.

The powdered forms are supposed to dissolve in boiling water, but they do not dissolve readily, and must often be kept boiling for some hours.

How it is Made.

Water-glass is made by melting together pure quartz and a caustic alkali, soda or potash, and sometimes a little charcoal. It will be seen that there is nothing that should get musty.

I think the two kinds which appear in the market are known as German and American. The German formula turns out a black glass, which dissolves in about six times its weight of boiling water.

Dr. Santee said at one of the New York Poultry Institutes, that the German kind was usually used in proportion of one part to ten of water. The American form one part to eight of water. This is when purchased already dissolved.

As the German formula produces a black glass, it is easy to see where our inquirer's trouble arose. One druggist had sold the syrupy, jelly-like American form, and the other, sold the dark-colored German product. At least this may explain the difference in the two lots.

Egg-preserving Methods.

Of twenty methods of preserving eggs tested in Germany, the three which proved the most effective were coating the eggs with vaseline, preserving them in lime water, and preserving them in water-glass.

The conclusion was reached that the last was preferable, because varnishing the eggs with vaseline takes considerable time and treating them with the lime water may give them a disagreeable taste.

These drawbacks are not to be found with eggs preserved in water-glass, which unquestionably is the best preservative yet to discovered.

Personal Experience.

I can speak from my own experience, for I have packed eggs in it for four years and shall do so again this year. We are fond of fresh eggs and use a great many, and I find it most convenient to have a jar or crock full of nice eggs always at hand.

We're Checkerboard twins—hardy, healthy and happy. See our ad, page 315.

I have kept them myself for eight months and have no doubt but that I could have preserved them still longer had we not eaten them, for I found them to all appearances as fresh as if not over a week old. It costs about 1½ cents per dozen to preserve them.

Various Experiments.

Several of our Experiment Stations have made some rather exhaustive experiments with this dissolved glass in preserving eggs. The reports are, without exception, in favor of it.

No other preservative is reported as being equal to this one. The stuff is invariably described as a thick or jelly-like liquid, and the proportions recommended are one pint of the silicate of soda to nine pints of water, although the Rhode Island Station reports experiments in which as low as two per cent. of water-glass was used with favorable results.

This was done to find out how little could be used, but this small proportion was not recommended. Futher trials may show that less than nine to one may be reliable.

Directions for Use.

The directions for use are: Use pure water which has been thoroughly boiled and cooled. To each ten quarts of this water add one quart of water-glass. Pack the eggs in the jar and pour the solution over them.

The solution may be prepared, placed in the jar and fresh eggs added from time to time until the jar is filled, but care must be taken to keep fully two inches of water-glass solution to cover the eggs.

Keep the eggs in a cool place and the jar covered to prevent evaporation. A cool cellar is a good place in which to keep the eggs.

If the eggs be kept in too warm a place the silicate will be deposited and the eggs will not be properly protected. Do not wash the eggs before packing, for by so doing you will injure their keeping qualities.

Probably by dissolving the mucilaginous coating on the outside of the shell. For packing use only perfectly fresh eggs, for eggs that have already become stale cannot be preserved by this or any other method, and one stale egg may spoil the whole batch.

Some Adverse Reports.

Prof. Ladd of the North Dakota Agricultural Station spoke of receiving a few complaints that barrels were not proving satisfactory. The water-glass appearing to dissolve some product which deposited on the eggs.

He thinks this might be attributed to the presence of glue, which had been used as sizing for the barrels. In such instances, charring the barrel inside with thorough washing thereafter, is recommended. Altogether the preference seems to be for glass or stoneware vessels.

Prof. Ladd's statement as to the satisfactory results of the water-glass method is very strong. He says:

"This method has been tested in a commercial way, in nearly every state and part of our country, and we have not had to exceed eight adverse reports."

Get Good Material.

One of the stations affirms that the failures reported are probably due to receiving water-glass of poor quality.

It is also stated that these, like all preserved eggs, contain a little gas, when boiled they will be likely to burst unless previously pricked through the shell at the large end.

As the entire processes of preservation are an effort to fence out germs, the recommendation not to wash off the mucilaginous coating which nature puts on the eggs, and also to use only boiled water, appears very logical.

When we know just what we are aiming at, we are less likely to omit the little precautions which otherwise might seem like the whims of some fussy person. Too many people skip the essentials when trying to follow a formula.

I have no objection to telling where I purchase mine, I get it either at the "Sun Drug Store" price 85 cents for a single gallon or at the rate of 65 cents per gallon for five gallons and 60 cents gallon in ten gallons lots, or I get it at the Owl Drug Store. The price here is 40 cents a quart, $1.25 a gallon or $1.10 in five gallons lots and $1.00 a gallon in ten gallons. The Owl Drug Store claims that the reason their's is dearest is that it is pure. Both stores sell the American make. They do not keep the dry powder.

CHECKERBOARD CHICKENS

BRING HIGHEST MARKET PRICES.

Why are you raising Chickens? For your Health, or to Make Money?

If you want to raise the best chickens—chickens that will produce the most eggs, and chickens which when sold will bring the highest market price—you want to pay more attention to what you **feed** your poultry.

Any old kind of poultry feed will produce any old kind of chickens, but it takes the **best poultry feed** to produce the **best chickens**—chickens that make you a profit. Mixing a few things together doesn't make a Poultry Feed. It is a scientific proposition and requires a thoroughly equipped mill to grind and clean and screen and blend together grains and seeds in just the right proportion for the baby chicks or the laying hens.

ASK FOR THE CHECKERBOARD BAG.

All Purina Poultry Feeds are put up in Checkerboard Bags, to insure that you get the original feeds. **Every bag is absolutely guaranteed.**

PURINA POULTRY FEEDS are made from sound, sweet grains and seeds thoroughly cleaned and sifted. No smutty or burnt wheat. NO GRIT or SHELL. Our reputation is back of every Checkerboard Bag. A feed for every purpose. Purina Baby Chick Feed to develop the little fellows; Purina Scratch Feed for every day in the year; Purina Egg Food to make hens lay, and a green feed for the year 'round.

THE BLACK MINORCA.

The Black Minorca, (of which there are two varieites, the Single and Rose Comb,) is among our best fowls, not only for the fancier, but the utility man. No doubt all Minorcas are decendants from the Single Comb Black, as their history goes farther back than either of the other varieties. It is said that the Whites are from the Black, and their admirers claim that no foreign blood was used in their make-up; yet we have heard this disputed by men who ought to know. However, this part of the subject we will not discuss.

History.

As to the real history of the Single Comb Black, very little is known, although they have been an established breed for over sixty years, and there is little doubt, but that they were imported from the Island of Minorca, one of the largest of the Beloric group in the Mediterranean Sea. Just when the first importation was made we have no definite authority, but we do know where they got their name, and why they are placed in the Mediterranean class.

Mr. Lewis Wright says, in the Illustrated Book of Poultry: "There is more evidence than usual for the source of this breed being truly represented by its name. Mr. Lewrothy told us that Mr. Willis, a friend of his, had seen them in Minorca, and the Rev. Thomas Cox, of Castle Cary, informs us on direct authority of Sir Thomas Ackland that his father, the former Baronet, undoubtedly brought some from that island direct to England in 1834 and 1835, and kept them for years at Holnicote. It is doubtful if the fowl was not already known in the west of England, but there is no doubt that one strain did diverge from this ascertained importation, and the breed was for years known and prized in Devon, Cornwall and Somerset, before known elsewhere."

Just when the first importation was made to this country, we cannot say, but we know that they have been bred for a long time,—so long that the type has been fixed until they will reproduce themselves to a marked degree. When they were first bred in England, they were not considered a fancy fowl. There was no separate class for them, and they were ignored as an exhibition fowl, and were bred solely for their practical purposes, which now only adds to their value.

It is claimed that they lay larger eggs and more of them than any other fowl known. We give them credit for laying the largest egg of any bred; yet as to their laying more, we cannot say, as we never saw them in a test with other egg-producing fowls, such as the Leghorn, Andalusians, Rocks, Wyandottes, Reds, etc.

Shape.

A typical Black Minorca is distinguished for its length, firmness of build, and haughtiness of carriage. Its movements are graceful, and it has a commanding appearance. Those not acquainted with the breed are often deceived in their weight, as their feathers are very close, which makes them appear much smaller than they really are. The Standard weights for the Minorcas are: cock, nine pounds; cockerel, seven and one-half pounds; hen, seven and one-half pounds; pullet, six and one-half pounds.

A Black Minorca Breeding Pen

Perham & Wheeler, Lordsburg, Cal.

Something like two years ago the Standard weights of the Minorca were raised one pound, or to the present weights, by the American Poultry Association. This is considered by many breeders as being too high, and being detrimental to the breed, as in breeding for the extra weight many of the true Minorca characteristics have been lost, as it gives the breed a stilty, clumsy appearance, and that in breeding and feeding for the extra weight the egg production has been retarded. We know that there is a movement on foot now to get the Standard lowered to their original weight.

Black Tailed Japanese Bantams

I have purchased of Le Roy Burnell his entire flock of these miniature beauties, including all the prize winners at the late Los Angeles Poultry Show. These, added to my original stock, give the following prize winners: 1st and 2nd Cocks; 1st and 2nd Cockerels; 1st, 2nd, 3rd and 4th Hens; 1st, 2nd, 3rd and 4th Pullets; and 1st and 2nd Pens, which makes the largest and best flock on the Coast. ***Eggs, $2.00, $3.00 and $5.00 per 15. A few trios for sale.***

Frank J. Ironmonger, 315 So. Main St., Los Angeles, Cal.

The Columbian Wyandotte Specialist

NOTICE TO MY BARRED ROCK PATRONS:

On January 10th, 1907, I assigned over to H. T. McCULLOUGH, of Monrovia,, Cal., all my right, title and interest in the Arrowhead Strain of Barred Plymouth Rocks. Hence, the McCULLOUGH POULTRY FARM is the only one that can supply eggs and stock direct from the original birds and from matings made, personally, by me, to produce high-brade breeding and exhibition specimens. Thanking my many fancier friends, patrons and the public for their trade, and bespeaking for my successors a continuance of their valued favors. I remain, Fraternally yours, S. M. BUTLER.

Starbuck's Barred Plymouth Rocks

We Trap-Nest Our Hens. Bird Laying Qualities are inherited. Why set from poor layers? We use pedigreed cockerels whose mothers have for over six generations laid over 200 eggs per year. Eggs from old hens, $1.50 and $2.00 per setting of fifteen; from pullets $1.00 per setting of 15. No sales or visitors Sundays.

Wm. Starbuck - Fullerton, Cal.

Chicks Just Hatched

We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.

Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.

CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

MY EXHIBIT OF
WHITE, BUFF AND PARTRIDGE **Wyandottes**
Won 26 Ribbons and Special Prizes at the Poultry Breeders' Show, 1907
R. D. Box D87 **L. E. BERKEY,** Fullerton, Cal.

evenly separated, having six regular and distinct points, the middle point the longest. It should be thick at the base, so as to keep it in upright position. Comb of female, large and drooping to one side of head, forming loop over beak, deeply and evenly separated, having six regular and distinct points.

The rose comb of the cock should be square in front, firm on the head, tapering evenly from front to rear, ending with a well-defined spike. Top rather flat, covered with rounded points. The comb of the female, should be practically the same as the male, only smaller. The comb, face and wattles should be bright red.

Carlotta

Black Minorca Pullet, who has the best show record of any Minorca female on the coast. Owned by Perham & Wheeler, Lordsburg, Cal.

The ear lobes should be almond-shaped, pure white, and smooth. Plumage should be rich, glossy greenish black throughout, free from any foreign color, and should be free from purple barring.

To those who want a good all-purpose fowl, we can recommend the Black Minorca as a very hardy breed, good layers and foragers.

For the climate of the Pacific Coast we consider the Minorca one of our best breeds, as here we have no frosts to nip the large comb and wattles. Their comb we believe is a serious handicap in the cold climate.—Frank H. Thomas.

POULTRY POINTERS.

Scald out the drinking vessels every few days and keep them as clean as possible.

Keep the poultry house dry, for damp poultry houses are breeding houses for disease.

The best condition powders for the poultry consists of clean quarters, good feed and pure water.

A variety of food will help to keep the hens healthy and will also be good for the egg production.

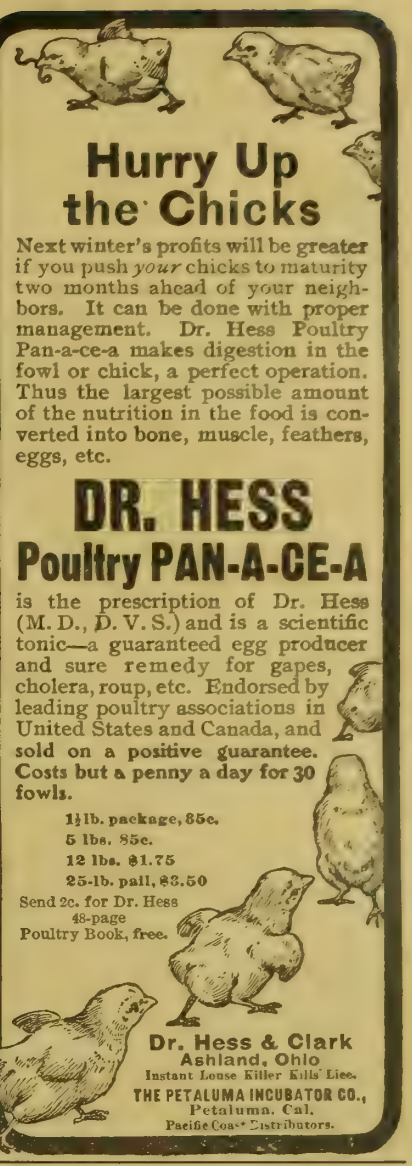
The hens should always have a dust bath handy, winter and summer. This will help keep the fowls free from lice.

Forcing egg production is a dangerous practice if the flock is a good one. Keep them in good condition and they will do their part.

The three great factors in winter production of eggs are cut-bone or meat, green food in some shape, clover or roots, and exercise.

Change the food for a day or two if the fowls have bowel disease. Half of the troubles of this kind can be traced to a lack of sharp, hard grit.

Did you say Checkerboard? That's me. See my ad, page 315.



Hurry Up the Chicks
Next winter's profits will be greater if you push your chicks to maturity two months ahead of your neighbors. It can be done with proper management. Dr. Hess Poultry Pan-a-ce-a makes digestion in the fowl or chick, a perfect operation. Thus the largest possible amount of the nutrition in the food is converted into bone, muscle, feathers, eggs, etc.
DR. HESS
Poultry PAN-A-CE-A
is the prescription of Dr. Hess (M. D., D. V. S.) and is a scientific tonic—a guaranteed egg producer and sure remedy for gapes, cholera, roup, etc. Endorsed by leading poultry associations in United States and Canada, and sold on a positive guarantee. Costs but a penny a day for 30 fowls.

You Can't Help Having Success with

GLENDALE INCUBATORS

Nothing but genuine merit can account for the widespread success of Glendale Incubators and Brooders. Shrewd arguments can be devised to sell incubators but the real test is what an incubator will do.

There is not much profit in selling Glendale Incubators and Brooders but they give satisfaction and make friends.

Anyone can operate the Glendales. They do not require long study, constant attention and ideal conditions. The Glendales have practically revolutionized the poultry industry. They give results that are little short of astonishing. Their automatic action is almost human in its quick response to change in temperature, its wonderful regulation of ventilation.

Glendale Incubators and Brooders are sold with a positive guarantee of satisfaction or money back.

Why be satisfied with less profits from your poultry industry when Glendales will increase your earnings, save you time and work.

The 120-egg size, $22. 240-egg size, $32. 360-egg size, $42. 500-egg size, $52.

We want you to attend a free demonstration now being conducted. If this is not convenient, write for catalogue.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Lost Cud.

I have a cow sick for several days. I milked her in the morning and she gave her usual amount of milk but I noticed she grunted a little, but otherwise seemed to be in good condition. When I went to milk her in the evening she had no milk. She seemed to be bound up, so I gave her a dose of salts which opened her bowels, but she is not well, she don't chew her cud and don't give any milk. She eats very little, just mopes around, the neighbors say she has lost her cud.—J. F., Rincon.

To J. F. The loss of cud is merely a symptom, usually of fever or of indigestion. Examine the cow's nose and see if it is in the natural moist condition, showing a pink pickle of health. I presume you have no clinical thermometer, so try the homely way of taking her temperature by feeling the base of the horn. If hot the cow is feverish, if cold she is weak. Find out by feeling her all over firmly with your fingers if she is tender anywhere about her body; listen to her breathing. Try to find in what part of the body the trouble lies. Any sudden change may give a cow indigestion, changing from green or dry food, or the reverse, too much grain, that is pushing the dry part of the grain above one-third of the roughage consumed. A cold may have settled in her chest. You see this is only guessing. I would try to bring her back to her feed by giving her warm bran mash. Half a gallon of hot water poured on a quart of bran, salt and cover it until cold enough to feed. Then stir in a tablespoonful of a mixture of anise seed and ginger, add a teaspoonful of baking soda. Give her some choice hay to nibble at, if she refuses the bran take it away and feed to something else. If she has any acute trouble it will be better or she will be dead before this appears in print.—M. E. S.

Fatal Bloat.

My cow had been out eating a little during the morning but came in during the afternoon for a drink. As I was going away I left her in the yard. She appeared entirely as usual. At night I fed her the bran, let the calf have her share of milk, milked, then fed cow a leaf of alfalfa as usual.

Everything was as it has been. I saw no change or difference in anything. The cow has been and was at that time perfectly well as far as I know. I passed by her with lantern half an hour later, she was eating her hay; about half an hour after this I heard a peculiar muffled choking brawl, and by the third call I was there with lantern to find the cow lying on her side so swollen her upper legs couldn't touch the ground. There were only a few minutes of this when she stopped breathing. I would say it was less than fifteen minutes from the first cry of distress till she was dead.

I fed the same hay I had been giving, the same amount, and the horse and calf had some of same with no bad effects. The cow's milk that night had no bad effects upon the calf, although in an hour after calf took it the cow was dead.

After death the body continued to bloat terribly and blood oozed from all openings, eyes were nothing but blood by next morning.

Perhaps this conditon is familiar to cattle people, but it seems wonderfully sudden to me.—W. D. G., Lordsburg.

If it's Purina Chick Food, I want it, for I'm a Checkerboard Chick. See my ad, page 315.

Yes! Unfortunately I have lo many cows in just as quick time fro bloating. This is the form that peo rise up and tell you how they sa their cows, when you can truthfu say that it is all over before the is time. I once said I had conclud at times that I did not know an thing about bloating—it came une pectedly and went the same wa One person wrote to me that if I h melted a pound of lard and poured down the cow's throat it would ha saved her. You can see how impo sible it would have been for you have carried out that prescriptio The only thing to do is to stick the but I think that the cow ruptur herself before you reached her, wh she uttered the cry. I have never h more than a couple that recover after they had dropped. The caus I cannot tell only that the ear grasses seem to be acid and cau more gas than the later grass.

In the spring when the first gra comes it is a good preventive to gi the cows with their grain a te spoonful of baking soda. Do not distressed for had all the knowled and appliance of a stock farmer be at hand it would not have saved th cow.—M. E. S.

Contagious Ringworm.

I have a mare that is continual biting her legs and scratching he self against the sides of her sta little lumps about the size of a p form under the skin, and where the form the hair comes out in small spo about the size of a silver 5 cent pie Her colt which is two years old is a fected in the same way. Mr. Kell has consulted the best veterinary do tor here and he don't seem to rea the disease. Will the Cultivator plea tell what the disease is and sugge a remedy.—D. A. K., Ventura.

If these lumps do not break do and discharge it seems fair to co sider this contagious ringworm, t dam having given it to the co White wash the stables thorough wash harness, halter and collars wi strong soap and water. If there any dry, chaffy appearance to the spots wash them well with stro soap and warm water, when dry, r on the following: Iodine one-ha drachm, iodide of potash one drachi vaseline one ounce. Have this mix as an ointment and use twice a da

If the spots are not scaly the fo lowing can be used. Carbolic acid o part, acetic acid 20 parts, paint on with a feather. The colt may hard to keep tied up, if he is, t first oily ointment will do him harm, or chloride of iron can painted on the spots. If anywhe there has been open sores formed the incessant rubbing, these can healed with a cream made with o ounce of lard to 10 grains of nitra of silver. The animal should be c off from grain feeding except a h bran mash at night to open t bowels thoroughly each day, the feed them green feed or hay. The cu will be slow, it will require watchfu ness to prevent reinfection.—M. S.

Sulphuring Machine.

Can you tell me where I can pr curc a machine for sulphurin grapes?—B. J. A., Lancaster.

A number of French sulphurin machines were imported this seaso only a few were offered in the ope market. There are now none for sal Prof. Fred'k Bioletti has one in us at Berkeley, Mr. Frank Swett has o on his vineyard near Martinez.

Either of these gentlemen woul no doubt tell you about them. Th University has a bulletin in press o sulphuring of vines. This will b available almost at once. I am gla to see at last the vineyardist is figu ing on the cost a little of his grape

The knapsack sulphuring machine ses only 13 pounds of sulphur to the cre, while the hand bellows takes 9 pounds, the perforated can takes bout 25 pounds, I do not believe anyne ever dared to even think how uch sulphur was used when it was ut into a small burlap sack and aken over the vines.

The best sulphur we find is the eapest to buy, as it is light ough in weight to make it quite a ifference in the time it lasts. The ssing of frequent stopping to refill saved time. We use the sublimed or owers of sulphur, this is impalpably ne when rubbed into the palm of our hand.—M. E. S.

---

ating.

In your next issue will you kindly nswer the following questions: In one your old papers you say that hens at have been running at large with osters should not be mated for irty days. Why is this? Do a great any eggs become fertilized in the vary and require time to get rid of em? If not, what are the facts? Is there any way of telling the age hens?—B. M. G.

At one of the Experiment Stations number of tests were made to disover how long after hens were taken way from the male bird the eggs ould remain fertilized. If I remember rightly it was found that only one gg in twenty was fertile after twenty ays' separation and none after three eeks. Some people think that if a en has once been mated with another reed her eggs will not be sure to be ure bred for the whole of that season, st as if you cross-breed dogs the female will be spoiled. Whether this is e case with fowls I am not prepared say.

After a male bird has been introiced into a pen for the space of a eek the eggs should all be fertilized him, but if the hens have been runng at large with other males I would efer to wait a month.

There is no way of knowing the exct age of hens except by marking em in the feet, or by branding the gs. Experts can often tell an old n by her appearance or actions.—rs. A. B.

---

matoes Damping Off.

We have some young tomato plants at seem to be cut off at the base a sort of fish worm that seems be sucking them. They fall over fore the tops die. What can I do stop it?—E. E. M., Bryn Mawr.

Your plants evidently are damping and the worms are there after decomposed matter that is in the soil. rhaps your soil it too wet and has us been favorable to damping off. rth worms like wet places and congegate where there is an excess of isture. It looks as though your nts had been kept too wet. That uld favor damping off and also attact the earth worms. If the plants e several inches high, you may save em by transferring them to clear mp sand till they take a start and en plant them in the field or garen. In the meantime, you had bet- start new plants from the seed. ix plenty of sand with the soil and ep them just moist enough to ow well.—J. W. M.

---

ze of Hennery.

Please answer a question or two rough the California Cultivator, and oblige.

Is there room in a pen 25x25 with a ushroom house 6x8 for ten Brown Leghorns? Or would a pen 25x50 th a mushroom house with 20 hens better.—O. P. R.

Either would do equally well. But, think I should prefer the larger yard this climate especially if you have od shade in it.—Mrs. A. B.

---

leree.

Is Fileree and Alfilaria the same nt? What is the clover enclosed? D., San Bernardino.

They are the same, being species a plant known to botanists as Erom, of which we have several ecies quite common.

The clover having neither flowers r pods (it should have both) we can dy guess that it may be Trifolium acilentum, which it resembles in ss aspect.

Dark or White-shelled Eggs.

Why do people in California hold preference for white-shelled eggs; are not the brown-shelled as rich and as good?—F. W. F. Greenfield.

Analyses have been made of the different colored shelled eggs by some of the experiment station, among others by our own Berkeley station, and these have proved conclusively that there is practically no difference in the contents of the eggs, and that it is merely a whim of the customer to imagine any difference either in nutriti e value or in flavor. The New York market demands white eggs and the Boston market brown and the San Francisco market follows New York, even if Boston does claim to be the "Hub." Los Angeles uses both kind equally and in consequence there are more of the American breeds of fowls in this neighborhood, whilst near San Francisco the Mediterranean breeds predominate.—Mrs. A. B.

Borers and Crown Knot.

Is there a remedy for the borer? If there is, will you please give it in the columns of your paper? Also, is there is a remedy for the black knot on peaches?—J. C. W., Gilroy.

There is not much chance of helping a tree when it has once been riddled with borers, but they may easily be kept out. If the trees are but recently planted and the borers have not girdled them severely wrap them with sacks and the flies that hatch from the worms will not lay their eggs in the place where the sack is wrapped. To make it more effective, put a little sulphur under the sack. Using a whitewash with sulphur in it is very effective also. If the branches of the trees are in danger of becoming infested, spray them with the wash. It will not hurt the foliage.

We do not know of any remedy for the root knot. It may be checked by cutting out the infected part and washing with blue stone, one pound to ten gallons, but we do not know how to prevent its attacking a tree. —J. W. M.

Horse's Sore Throat.

Can you tell me what is best to do for a mare that slobbers. She is about 14 years old. I had a party who seemed to understand horses fill her teeth and he said she had an inflamed throat and advised a mustard plaster.—H. J. L., Pomona.

She should have her throat blistered and then kept well greased, and then turned out to grass. Many horses will not work when their throat is sore, they plunge and throw themselves. She would be likely to do so if made to trot a mile or so. Now if she cannot be spared to lay off, you might try rubbing her throat with a mixture of oil of turpentine, olive oil and solution of ammonia, equal parts. For internal use, mix 4 ounces of chlorate of potash, 1 ounce of powdered guaiacum in half a pint of molassas. Mix together and put a spoonful on the back of the tongue three or four times a day. If it is necessary to blister the throat, I like this blister, as it leaves but a slight mark on the horse: I drachm of croton oil, sulphuric ether and alcohol, each 10 drachms. Apply with friction.—M. E. S.

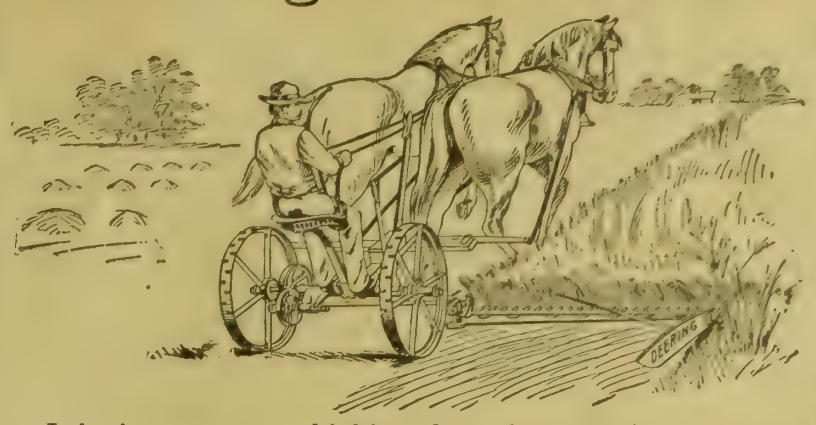
Use of Bordeaux Mixture.

Will it do to spray Emperor grape vines with bluestone and lime? I sprayed my peach trees in December and should they be sprayed again?—H. K., Fowler.

It will improve your vines no doubt to spray them with Bordeaux mixture, 5 pounds of lime, 5 pounds of bluestone to 50 gallons of water. It will hold in check to some degree any fungus, such as mildew, by killing some of the spores. You must not, however, depend on it as sulphur should be used for that after the vines begin to grow and after the grapes are set.

If you have signs of the blight on your peaches, or if it is in the neighborhood, it will pay you to spray again. Do it just after the trees are out of bloom.— J. W. M.

Deering Ideal Mower



It is time you were thinking about the mower you will need this season. Of course you want the best—that means the Deering, for the Deering **IS** the best. It is the lightest draft mower made; is simple and durable, with few parts to wear or get out of order. It cuts from the start in heaviest grass or grain. It's just what you want. We have a few of these machines on hand now and expect to have more soon, but the railroads are very slow in delivering freight from the East and it will pay you to buy now—and be sure of having your machine when you want it. We have the Deering self-dump rakes, too, and there is nothing better.

Hawley, King & Co., Agents

8 Varieties of Wyandottes

Each Bred on Separate Farms. Quality Best. Eggs and Stock guaranteed. For particulars write for catalogue.

Queen Poultry Co. **Box 2, Los Angeles, Cal.**

Grafting Wax.

Will you please give through your paper a receipt for grafting wax?—B. M. C., Yuba City.

Wickson gives as a good receipt the following: One pound of mutton tallow, 2 pounds of bees wax, 4 pounds of resin. Melt this all together and stir well while it is boiling. This is much improved by pulling as you would candy. Take it from the stove while hot, pour it into a tub of water that is of such a temper that you can bear the hands in it. Have the hands well greased and pull it till it gets stiff. This will make a stiff wax that will not crack so readily as when not pulled.—J. W. M.

Sucking Cow.

Will you please tell me if a cow that sucks herself can be cured, and if so, how?—C. R., Corcoran.

I have never known a cow cured of self milking. The milking can be prevented by using a halter on her head having a short chain from the ring and fastening a broom stick to it. Then use a broad girth around her body, pass the broom stick beween the front legs and fasten it to the girth. This way is the most humane way of harnessing the cow as she cannot hurt herself.—M. E. S.

No Nitrate of Soda used — Giant Hay Crops — Nitrate of Soda was used here

An average increase of 2775 pounds per acre of field-cured hay was shown in 11 actual tests where Nitrate of Soda was used. Tests were made from Nova Scotia to Missouri, and only 100 pounds of

NITRATE OF SODA

was used per acre. Compare increase with cost of this great fertilizer. Compare fields shown in above actual reproduced photograph. Nitrate of Soda is best and cheapest Nitrogenous fertilizer with which to furnish Nitrogen to plants.

Test It for Yourself Entirely Free Let us send sufficient Nitrate of Soda for you to try, asking only that you use according to our directions, and let us know the result. To the twenty-five farmers who get the best results, we offer, as a prize, Prof. Voorhees' most valuable book on fertilizers, their composition, and how to use for different crops. Handsomely bound, 327 pages. Apply at once for Nitrate of Soda, *as this offer is necessarily limited.* Valuable illustrated books of useful information, will be sent free to farmers while the present edition lasts, if paper is mentioned in which this advertisement is seen. *Send name and complete address on post card.*

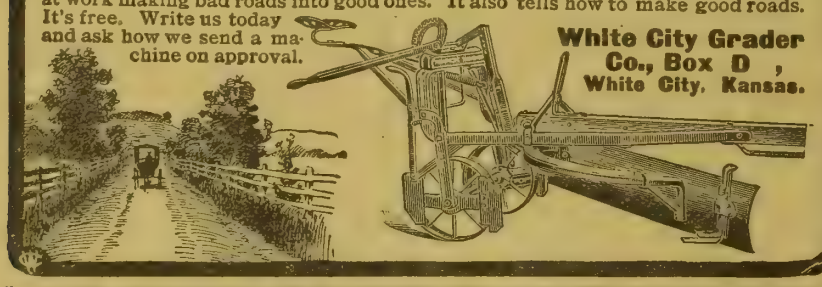
WILLIAM S. MYERS, Director, John Street and 71 Nassau, New York

IT'S DELIGHTFUL to RIDE ON A SMOOTH COUNTRY ROAD

not only for pleasure but when you're hauling two-ton loads of baled hay. It's possible to have them when the dirt is handled right. The 20th Century Grader does it cheaply, quickly, thoroughly. No matter how clayey, muddy or rough the dirt road, it can be changed in 24 hours to a level, smooth, rutless highway. This machine is worth hundreds of dollars in the spring or fall—just the time when farmers haul their year's earnings to the market. The

20th CENTURY GRADER

is strong, rigid, durable. Puts the dirt anywhere you want it. It is easily guided and handled; light draft, two horses and one man can grade and shape a road in double-quick time. Mould-board is reversible and can be turned to either side to angle of 50 degrees. Patent shoe equalizes depth to which scraping edge cuts. Send for our new book "Delightful Roads" and see views of 20th Century Grader at work making bad roads into good ones. It also tells how to make good roads. It's free. Write us today and ask how we send a machine on approval.



White City Grader Co., Box D, White City, Kansas.

FREE **A Booklet That Will Help You Get More Money**

Mr. L. A. Aspinwall, authority on potato culture has written a book for potato growers. We want to send you a copy free, also our illustrated catalog containing valuable spraying information and describing the

ASPINWALL POTATO MACHINERY most perfect machines for the potato growers' needs—Cutters, Planters, Sprayers, Diggers and Sorters, including the Famous Planter No. 3, with sack hopper, plants 99 per cent good without bridging in hopper. The triumph of the long years we have devoted to building potato machinery.

Write today; be sure to ask for booklet, **Potato Culture.** We will send it free and catalog of our entire line.

Citrus Culture and Allied Topics

Continued from page 269

A gentleman, whom I was advising in the culture of his grove, wrote to me that gophers had attacked two rows of his finest trees—seedlings—leaves were yellow, wilting, fruit dropping, and he was sure he was going to lose them. I visited him and on looking at the trees, saw at once that gophers had not been near them.

Situated at the lowermost end of his grove, which had a uniform slope in a single direction, and could be irrigated from one side only, the successive years of irrigation, and rainfall, had buried his trees from eight inches to one foot below the normal depth at which sweet seedling crown, or main roots could run and remain healthy.

I told him that I could save his trees and also the crop thereon, if the slime-mould which had attacked the roots had not entirely encircled the main roots. I prescribed removing the dirt at once, telling him what he would find in the condition of the roots, of the slimy and sour state of the rotten cambium, and what treatment to pursue. In six weeks the trees were renewed in vigor and color, they ceased dropping the fruit, and ripened what remained.

I have had several experiences of this kind wherein my advice has been asked.

As a farther illustration permit me to call your attention to the condition of so many of the sweet seedling groves which one can observe, wherever they exist, with tops filled with dead wood. A direct tax equal to the loss sustained by trees being in a preventable bad condition, would create an uprising among citrus growers.

We complain of high railroad tariffs, but to many a grower the excessive freight is small compared with the loss through a diminished crop which he unnecessarily causes by not knowing what he can readily learn.

I suggest that some elementary reading in soil culture be done. Goodrich's "First Book of Farming," or a book by Voorhees in the Rural Science Series, "First Principles of Agriculture," edited by Bailey, be purchased. Even among old tillers of the soil, there is often need of knowing the primary principles of scientific soil culture.

I once said to the owner of several fine orange grove properties, who was complaining of the dry season: "Stir your ground, make an earth mulch three or four inches deep." He demurred, the ground was too dry already. I then showed him that in the middle of the sandy road where teams were continually passing the moisture was greatest, and nearer the surface than anywhere around us. Proper and frequent stirrings of the soil at the right time conserve the soil water.

Campbell's method of "dry farming" in the semi-arid regions of the western half of the Middle West is based on this fact. 12 inches of rain rightly conserved will do greater crop duty than twice that amount used, or rather neglected, in the customary way.

The reasons for this can be readily learned in one or two evenings' reading. Speaking of the Rural Science Series, edited by Bailey, permit me to say by way of parenthesis, that the most of the series is well worth reading and possessing.

In our modern horticulture we have come to learn the use of fertilizers in a practical and exact way in many particulars, which former generations did not apprehend. Not that we know it all even now, or even the major part of what is to be known, ought to be known, and can be known. But some things I say we do know, e. g.: We know that the soil wherein our plants have their roots, and whence for the most part they draw their nutriment and gather the forces that build their structures, is a living organism practically:—wherein operate and struggle all manner of forces, and agencies that tend to create, multiply, or destroy for recreation; the manifold marvels and wonders of plant and indeed of animal life.

The theory often stated concerning the ground, or soil, is that it is simply the anchorage, which gives stability to the plant or tree. It is that, and more than that. It is a great laboratory, wherein multiplied processes, chemical and biological, are at work—a great store-house of potencies whose energies are protean in character and form.

We do not understand one of a thousand of the infinite transformations, which make possible the growth of grass, or the crops of field and orchard.

A few years ago it was a popular fallacy, that the needs of crops of various sorts could be determined by an analysis of the soil. It is possible to determine the chemical elements in a given quantity of soil, but we have learned in recent years that not all, or even the greater part of the power and potency of life, lies in the chemical constituents of the soil. We have learned that the laboratory of the soil is far different, in its analyses and syntheses of chemical combinations, from the results obtained in the chemical laboratory.

The trees and the plants have a way of their own in this regard. Why, we do not know, it is enough for us to know it is so.

The citrus family in Florida, and largely so in California on some soils, objects to nitrogen derived from organic sources, such as blood and tankage. The chemist says "nitrogen is nitrogen," the citrus says, "not for me. I wish the salts of nitrogen." So of potash. The sulphate of potash is the only correct form for the citrus family. Cotton and cabbage will take kainit and muriate of potash, but the citrus family reject them, and suffering from them—perish. But potash is potash! Not at all.

Asparagus needs a dressing of salt. Salt will kill orange trees. Ferrous oxide of iron will destroy a grove as some Florida growers have learned, but add one molecule of oxygen by drainage, and ventilation through culture, and the orange will thrive.

We of California have been told that our groves do not need potash, that chemical analysis has determined this fact, as obtaining in both soil and our irrigating water. Exepriments with the living trees reveal the fact that the application of sulphate of potash in June is a profitable investment applied in suitable quantity.

I have used a fertilizer analyzing 1[illegible] to 15 per cent. actual potash applying ten pounds per tree. In one case the fruit was sold per pound. The fruit from that grove averaged nine pounds per picking box in excess o[illegible]

the weight per picking box of fruit from other groves well fertilized with ordinary fertilizers. I adduce these illustrations to show that in our dealings with the soil, and its agencies we are treating with a profound and vast array of conditions, which far surpasses our present knowledge to comprehend. We apprehend only a limited number of facts in relation thereto. Some of the facts are set down in books which are profitable for us to read, for example: Hickman on Manures, Griffith on Manures, Voorhees "Fertilizers" (Rural Science Series), and other works.

But after all is said and done the fact remains that intelligent and observant experimentation along lines generally conceded to be approximately correct is the only way to increased knowledge and success. I believe much in modern "book farming' as a basis for scientific reasoning and procedure, but not everything we wish to know, should know and can know, I repeat, is found in books.

There are innumerable problems yet to be solved. It is good this is so, it puts us on our mettle, it gives an intellectual stimulus and mental activity of the profoundest character and widest range in matters pertaining to our calling. Someone has said that a square foot of soil has in it meaning and revelation beyond the span of a man's life to comprehend.

Tennyson found in the chance growth of a tiny flower in a wall the hint of all possibilities of time and eternity in Man and God.

"Flower in the crannied wall;"
I pluck you out of the crannies
I hold you here, root and all, in my hand,
Little flower—but if I could understand
What you are, root and all and all in all,
I should know what God and man is."

The usual type of the soil-worker in books and on the stage is muscular—low of brow and dull of brain, accomplishing his daily task by sheer force of brute strength—"a brother to the ox." Not a few who should be better informed, still regard the soil-tiller in terms of contempt as being "only a farmer."

To him who views the great problems of the modern science of the soil in something like their vast and sublime proportions there is no calling so filled with potencies of inspiration and highest pleasure. The fault of dullness lies in men and not with subjects of their out-of-door calling.

Again there is no class of men who do so much minister to the necessities and the aesthetic qualities of their fellowmen as do the producers of plant and tree life with their products. I repeat that there is no calling that extends over so wide a field of intellectual pursuits, as does the calling, —the profession—of the modern scientific agriculturist and horticulturist.

"If eyes were made for seeing
Then beauty is its own excuse for being."

And if brains were made for use, for beholding the glory of the Lord in the earth, then surely no men have greater occasion for exercising them than he who daily associates with those marvels of life that spring into being and flourish by the intelligence that guides his ministering hand or languish and fail to come full circle in their life's cycle because of his ignorance or neglect.

And beside the mere knowledge that instructs the plant grower how to develop the objects of his culture to their full perfection, how many allied subjects there are to interest him and which in their ultimate relations bear directly on his failure or success.

For example, the instructive use of the microscope has enabled our men of modern scientific methods of study, to tell us many secrets of nature that but for this "wonder-working tube" we could not have not known; for instance, the relation of rain to pollen —first set forth by a German microscopist—or the transmission of malaria and yellow fever by means of different varieties of mosquito. With proper safeguards against bites of these insects the swamps of the south will be as free of malaria as any other portion of the country.

We had an expert out here a year or more ago to tell us some things the smallest acquaintance with the elementary microscopy of fungi would have taught. I have seen men incurring risk of losing 15 to 20 per cent. of their crop after it was picked, packed and loaded into cars by reason of the untold millions of spores, which were in the air of the grove where decayed fruit was permitted to desseminate them through the air; the same were found in cobwebby packing houses with dirty floors and cars that never were cleansed and fumigated since the last shipment was unloaded. A microscope slide with a 3-4-inch circle of glycerine would have caught these spores and the microscope would have told the story. Unfortunately for the grower, he does not know the facts and the packing-house people as a rule are unbelievers. So you and I, if we wish to avoid contemptuous looks and sneering remarks in reply to our suggestions, will keep our mouths shut and our eyes open.

The microscope opens up a whole world of knowledge of those things, which though they are as the small dust of the balance are among the supreme potencies of life and death in plant and animal, man not excepted.

I have not time to enlarge upon this subject; $50 will equip an investigator with a working outfit suitable for all pratical purposes. The simpler investigations are readily made by any one over fifteen years of age who can read and write. This is not mere theory but is capable of demonstration,—the relation of fungi to the destruction of insect life. In Florida many localities are depending on the various forms of fungi to destroy the white fly(Aleyrodes citri), purple and long scales. The red fungus (Sphaerostilbe coccophila) is an enemy of the San Jose scale (on peaches). The grey fungus (Opheonectria coccicola) attacks the long and purple scales.

The red aschersonia (Aschersonia aleyrodes) and the brown fungus attack and destroy the red scale.

An examination with the microscope will show that the Scutellista cyanea in California is subject to fungus attacks under certain conditions, which is the reason why under climatic conditions favorable to the fungus the Scutellista are singularly absent where they have been so plentiful.

Beyond this subject is that of the relation of insects to our citrus culture. This phase of our industry opens into many branches of study which have their problems of much difficulty to settle. Hereon occur the debates between sprayers and non-sprayers: Fumigators vs. Sprayers.

Here as elsewhere the successful citrus culturist must depend on his own intelligence and judgment. Orange and lemon groves represent individuals to a very large extent. The intelligent grower who acts on his intelligence as a rule is revealed in the character of his grove—all other things being equal.

It is well to read Smith on Economic Entomology and Sanderson on the same subject, or the work of that remarkable English entomologist, Miss Ormerod; and whether you are a believer in fumigation, to read "Johnson on Fumigation" will enlighten you on the subject. Not to exceed 2 per cent. distillate mixture will at least do temporary good in some ways to some of our enemies.

The secret of success in citrus culture, as in other callings of life is to "find out!" But to find out, requires open mindedness. I know of a citrus grower who did famously for a matter of two or three years with his citrus crops by liberal application of blood and bone. Hence he was enthusiastic over blood and bone. It was an ideal fertilizer he said. His trees, however, rebelled against the excess of a uniform diet. The grower would not listen to any advice on the subject that ran counter to his practice and belief. He came near ruining his grove. Then he switched off and gave them potash in liberal doses, withdrawing the nitrogen and phosphoric acid, which he had given them. The trees immediately seized on this element of their diet which had been denied them for several years. Of course they revived at once. Then potash was the thing until the trees showed that, like the man who is reputed to have prayed for pepper, they had too much of a good thing.

Florida and California are alike in having some men whose minds are closed to progressive knowledge. Florida had a period of clean culture for groves which came near exhausting the vitality of their trees as it did of sterilizing their soils. The effect on their trees did what reason and intelligent co-operating could not accomplish. We of California will learn the same lesson, and will plan not to exhaust the humus in our soils, but rather to increase it to a normal standard that will maintain a healthy biological condition therein.

Winter cover crops of the leguminosae will come to be a regular method of restoring what the summer heat and cultivation, together with the year's crop and growth, burn and exhaust from the soil. Time may substitute another procedure or make an addition to this method, but apart from application of stable manure and similar fertilizers, there is nothing to take its place at present.

The question is often asked, "Is not bacterial inoculation possible." It may be. It is not a success to the extent that it has become a commercial quality available to the practical production of increased crops. I have tried it. I am aware that in Sweden and elsewhere nitrogen factories have been established, and it may be their products can be bought, sometime in the future, by the horticulturist to his profit, but that time is not yet, at least for citrus growers in California.

In the meantime we must seek more light, and do with our culture, as a famous painter said he did with the color he laid on his picture, "mix it with brains."

Clara.—I wish I could believe what he says, but—!

Maude—What does he say?

Clara—Why, he says he loves me, yet he has only known me two days.

Maude—Well, perhaps that's the

We're two lusty little Checker-board Chicks.

The Produce Markets

Los Angeles Markets

LOS ANGELES, March, 20, 1907.

There was an average volume of business transacted in the produce market this morning, but owing to the rain just at the time of the call there were few members present and a dull session resulted.

The butter quotation committee made no change in the official selling price of butter. Receipts as shown for yesterday were far above the estimated amount needed to meet consumption, most of which came down from the north by boat. This did not effect the market materially owing to its big cost in the north. If present weather continues the decline in prices which has been predicted for the middle or the last of this week is not likely to take place. Heavy storms in the north are also against a decline and if conditions there remain as they have been for the last two days it is very indefinite when a drop in prices will occur.

Valley Creamery	67½
Coast, fy,	60
Cooking	20

Cheese

Cal. Young American, per lb	20
California Anchor	19
Cal 3-lb. hand	21
Northern	17
Domestic Swiss	20
Imported Swiss	29

Eggs and Poultry

There was no change in the price of eggs. The arrivals yesterady were less than for the two days previous and considering the amount of eggs that are going into cold storage daily the market is about firm at the existing quotations. It was reported that more than ten cars of eggs are now in cold storage.

Eggs, local, per doz.	20
Northern Candled	19
Fresh Eastern	18

The following are average prices which dealers pay to producers for live weight:

Young Bride: "What miserable little eggs again! I really must tell the grocer to let the hen sit on them a little longer."

TO GET THE MOST AT

HARVEST TIME

WITH THE LEAST EFFORT

That's what you want—the best harvest results at the least expense of time and labor.

When your grain and grass ripen, you are too busy to waste any time on needless work or on delays and breakdowns.

Every minute counts.

That's the reason you buy harvesting machines—to save time and labor.

And the better the machine, the surer you can be that it *will* save time and labor—that it will go right through the harvest without a stop or hitch or delay, from start to finish.

You want to be sure *now*, that you are ready for harvest.

Be sure that you have a machine that will cause no trouble at your busiest time.

Be sure that your machine will get all the grain you have grown, with the least possible waste.

Be sure that it will be easy on your team, that it will give you long service, that you can get repairs for it easily and quickly when repair parts are needed—in short that you can depend upon it at all times.

You cannot tell a great deal about a machine by looking at it.

But its *record*—its performance in the field—what it has done for the men who have bought it and used it through a number of years—*that* tells a story which means everything to you.

Of the many types and styles of harvesting machines put on the market in the past thirty to forty years, there are a half-dozen that have always stood head and shoulders above the others.

Why? Why have the

Champion, McCormick, Osborne, Deering, Milwaukee, Plano—
HARVESTING MACHINES

always been such great leaders? Why have farmers purchased them in so great numbers? Why are they used the world over, wherever grain and grass are grown? Why do they hold the supreme position they do? You know the reason.

There can be but *one* reason, and that is this:

They have always done good work—they have satisfied their users—they have *proved* by a generation's use that they can be depended upon.

Their popularity and their reputation have not come by chance.

They have earned their reputation by their work in the field.

They have won their popularity by deserving it. And it is impossible to get a higher endorsement than that.

Today, these six lines of harvesting machines, the International line, are more popular than ever before, because they are better than ever before.

By working together the several manufacturers have been able to improve the principles of construction, to improve the quality of materials used, to improve workmanship, and to employ every means that will increase the machines' efficiency, durability and satisfaction.

The underlying principles of these machines are what thirty years' time, thirty years' experiments, thirty years' practical tests at the hands of grain and grass growers, have proved to be the best, and by working together, the manufacturers are able to maintain experimental shops, and to conduct field experiments which would be impossible for any one of them working alone.

In this way they are able to discover and devise better methods of operation, better principles of construction and so to make the machines more efficient, more easily operated—better for you and better for your pocketbook.

The enormous demand for these six leading makes of harvesting machines gives their manufacturers the first choice of both materials and skilled labor.

They are able to own and operate their own coal and iron mines, their own smelters and steel mills, their own lumber camps and saw mills.

At the same time, the choicest materials in all these lines are offered first to these manufacturers because they are such large purchasers.

In this way they are independent of fluctuating markets, and are able at all times, to select for every machine they make, only material of the first quality and the highest grade.

The same condition exists in regard to skilled labor. Experts in every line naturally turn to these manufacturers so that they are able to maintain an organization which they could not possibly maintain were they working separately.

These are some of the reasons why so many farmers cannot be persuaded to buy other than the International line of harvesting machines.

They are made *right*, on the right principle, from the right materials, and as a natural result they do the work they are designed to do in a most satisfactory manner.

In all conditions of grain, light, heavy, standing, down or tangled, they can be depended upon with absolute certainty. With one of them you can be sure that you will get *all* your crop at the least expense of time and labor, with no delay, no trouble, no annoyance. Isn't that the kind of harvesting machine you want? Don't delay, then; don't wait until harvest is upon you.

See the International Dealer and get a catalogue of whichever machine you want.

If you don't know an International dealer, write to nearest general agency for catalogue. Don't forget this other advantage. If your team runs away or an accident occurs, you can *always* get repairs for an International machine, near at hand, and they *always* fit. Repair stocks with local agents everywhere.

WORTH WHILE.

It is easy enough to be pleasant
When life flows by like a song,
But the man worth while is one who will smile
When everything goes dead wrong.
For the test of the heart is trouble,
And it always comes with the years,
And the smile that is worth the praises of earth
Is the smile that shines through tears.

It is easy enough to be prudent
When nothing tempts you to stray,
When without or within no voice of sin
Is luring your soul away.
But it's only a negative virtue
Until it is tried by fire.
And the life that is worth the honor on earth
Is the one that resists desire.

By the cynic, the sad, the fallen,
Who had no strength for the strife,
The world's highway is cumbered today;
They make up the sum of life.
But the virtue that conquers passion
And the sorrow that hides in a smile—
It is these that are worth the homage on earth,
For we find them but once in awhile.
—Ella Wheeler Wilcox.

A FORTUNATE FIND.

"IF we had but a few hundred dollars, Hans," said Gretchen, "it would be possible, but with nothing what could we do? Our wages are too small to save anything. We should have to pay all we earn for board and would never have a home. Let us wait awhile."

Hans did wait awhile, but there seemed no more prospect after it than before, and he grew impatient. Gretchen coaxed him telling him she had saved $60 during the year and if he would save the same in three years they would have enough to buy furniture and could go to housekeeping. Then together they might live cheaper than apart and save more money for the family to come. Three years seemed a long while to Hans. Besides, a man is not as good at saving as a woman, and he had not put by more than half what Gretchen had.

One day when Hans was walking on the street he saw right under his nose a fat pocketbook. Some one had evidently dropped it but a moment before, for people were passing continually. Hans picked it up and hurried on, thinking to overtake the owner, for he was an honest fellow, and every one he passed he asked if he had dropped anything. All looked at him in surprise, and some felt in their pockets, but no one claimed the property. Then Hans, thinking that the loser must have been going the other way, desisted. He took the pocketbook to his room, opened it and found $650 in bills. He carried it to Gretchen, and they consulted what they should do. Neither of them thought for a moment to keep what would be a treasure to both, and they decided that Hans should take it to the police, who would doubtless try to find the owner.

The next morning Hans started for the police office and, passing a point near where he had found the pocketbook, saw a notice posted of the loss and saying that if it with its contents was returned a quarter of the contents would be given to the finder. Hans went back to Gretchen and told her of the notice. "We are in great luck," he said. "A quarter of $650 is $162.50. With that we can buy enough furniture to commence housekeeping. Gretchen admitted that it would certainly bring them nearer to their desires and advised him to go at once and deliver the money.

He found the man who had lost it a disagreeable looking creature with blear eyes, snaggle teeth, a hook nose and a cunning expression. Hans handed him the pocketbook. He opened it, felt of it, looked in it and, effecting great surprise, asked:

"Vere is the di'monds?"

"What diamonds?"

"The di'monds that vere in the pocketbook with the monish."

Hans declared that there were no diamonds, whereupon the Jew began to abuse him for a thief. Hans, beside himself with rage at being accused of swindling and especially at his accuser's evident intention to deprive him of the promised reward, made a dash for the pocketbook. The Jew cried lustily for the police, and an officer came running into the shop. Hans and the Jew stated their case, and the officer took them before a magistrate, together with the pocketbook and its contents. The magistrate heard the story of each, giving especial attention to the Jew's statement, asking him many questions respecting the jewelry, their size and value. Then he questioned Hans, drawing out the circumstances of finding the treasure and his returning it. When he was satisfied as to the merits of the case he turned to the Jew and asked:

"For what did you advertise?"

"A lost pocketbook, your honor, containing $650."

"And how many diamonds?"

"No di'monds, your honor."

"Why didn't you mention them?"

"Because I didn't want any one who found them to know what they was."

"That was very prudent of you. Knowing their value, the finders would have been more likely to keep them."

"Yes, your honor."

"And the money and the diamonds were in the pocketbook?"

"Yes, your honor."

"The contract you made with the finder was to return a pocketbook containing $650 and you would give him a quarter of the amount for a reward?"

"Yes, your honor."

"Very well. Since this pocketbook contained only $650 and no diamonds it can't be yours." Then, turning to Hans: "You keep the pocketbook and the $650 until the owner calls for them and if he never calls for them they are yours."

The Jew protested, but the magistrate was inflexible. He cried and wrung his hands, while Hans walked away with the pocketbook, followed by the Jew, who offered him all the money if he would give up the pocketbook. Hans would do nothing till he had seen Gretchen, so he declined the offer. The Jew offered more and more money till by the time he had reached Gretchen the amount was $6,000. The lovers offered to accept the amount if he would state his reasons for offering so much; thereupon the Jew asked them to open the pocketbook and show them an inner pocket containing diamonds worth $20,000.

The lovers decided to refer the matter to the magistrate, who awarded them an amount equal to one-quarter the value of the contents of the pock-

etbook, the sum offered for its re-turn. This amounted to $5,162,50.

Hans and Gretchen got married, bought a little house, furnished it and have since been living happily to-gether. They consider America a great country.—Bertha D. Hurley.

ART OF WRITING LETTERS.

The writing of letters is something n which all of us are more or less in-terested. However, reluctant we may be to write a letter, we usually experi-ence a pleasurable sense of anticipa-tion when we receive one.

We are told that the art of writing etters is dead. Surely, in this age of wide-spread education and high-class iterature, this cannot be true. Not the ability, but rather the incentive is acking.

So many persons still cling to cer-ain time-worn experessions, each let-er being nearly a repetition of former ones, that correspondence becomes irk-some and soon dies a natural death.

Let your letters breathe of your own ndividuallity. Strive for originality of thought and expression. Be careful in your choice of stationery, in spelling, n construction and in the general ap-pearance of your letters. The ability to write correct and interesting letters s worthy of special effort.

It is surprising how many fairly well educated women, who are above criti-cism in matters of dress and the ap-pointments of home, are shockingly careless in their letter writing.

Lack of proper training in early life may, to a certain extent, be responsible for this. More painstaking attention should be given to this subject in the anguage and grammar grades of our ublic schools.

Special inducements, such as prizes, may be offered, if necessary, to stimu-ate interest, and the work continued ntil the student is enabled to paint is thoughts in beautiful word pic-ures—a delight to himself and his orrespondents.

Let the reformation begin, and rest ssured that every such white-winged nessenger sent speeding on its way vill be to its recipent a powerful in-entive to greater effort.

ORCHARD POINTERS.

An orchard with the trees planted ar apart is more profitable than the losely set orchard after the first few years of bearing. But the distance should vary somewhat according to soil and variety planted.

In pruning young apple trees do not cut back the limbs when it may be avoided if early bearing is desired. Fruit buds first form near the ends of the older branches, and multiply back n succeeding years. If cut back the new growth needs two or three sea-sons to gain sufficient maturity to form fruit spurs. Thin out branches where necessary and keep tree in shape without sacrificing leaders.

Orchards well located and in full bearing are worth anywhere from $500 to $1000 per acre, according to their location and nearness to good mar-kets. Many a ten or twenty acre or-chard has paid to its owner the full purchase price with one season's crop. Good orchards cannot be bought for any price because their owners know that they cannot invest in anything that will pay the same dividends.

While she cannot throw a stone, a girl can heave a sigh.

A good cow coins her owner a little money every day.

THE WOMEN OF CHILI.

The women possess a beauty of their own, and in a social gathering at the Chilean capital one will see as many charming women, as well dressed and possessing the most per-fect manners, as in any city of its size in the world, says a writer in the Na-tional Magazine for February.

Possibly one secret of their at-tractiveness, and that of the children, is that they seem to be physically strong, and rejoice in that best of blessings, radiant good health, and while the Chilean is of Latin stock, the women have nothing of the frivol-ity and heartlessness of the Parisian. Society, both in the upper and lower ranks, is permeated by a genuine re-spect for woman which makes itself felt everywhere.

On the street, at the theater, in pub-lic places, the spectacle of the loud-voiced, flirting young woman is ab-solutely missing, and the public con-duct of the women of all classes is above reproach. Outrages against women and girls, such as shock the sensibilities of decent people in Chi-cago, New York and other American cities, are unheard of in Chile. In the forenoon the streets of Saniago are filled with women, who wear the "manto," the Spanish wrap which con-ceals all the person except the face. This picturesque garment is passing from popularity in Peru, but it still holds sway in Chile. Yet on festive occasions, Chilean maids and matrons make themselves attractive with the best Parisian styles, which they know how to wear in a modest and woman-ly manner.

INJURY BY RABBITS.

The following is the plan for pre-venting rabbit injury to fruit trees. given by a Missouri orchard owner:

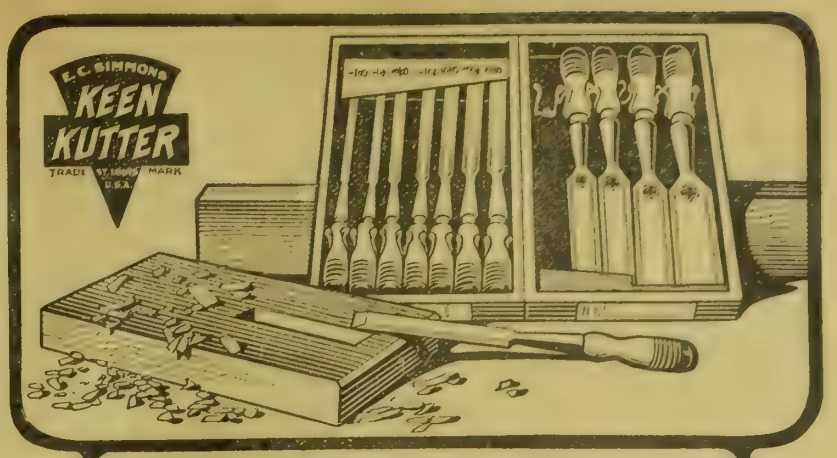
"For years I have discarded washes and used the strongest paper I could find. Some periodicals of extra heavy texture I lay away expressly for this work. One sheet about eighteen inches long is enough for one tree. Cut strings into six-inch lengths, and after wrapping the young tree, tie the paper twice, above and below. It will often stay on for two years if not removed in the spring, which it is best to do for the health of the bark.

A pruning knife should be at hand to cut off spurs and sprouts that would interfere with the fitting of the paper. A little practice at wrapping and tying will soon enable you to do the work quite rapidly. It is better to thus safeguard the trees early in the fall for I have seen trees gnawed in September, but unless rabbits are very plentiful they will usually not molest the trees until snow falls.

The best rabbit trap is the box about two and one-half feet long, with the rear end covered with wire netting to give the appearance of being open. It has a drop door in front with the usual trigger arangement through a hole in the top. Bait with something the rabbit has not got. A cabbage leaf is good.

CREAM OF TOMATO SOUP.

One quart stewed tomatoes or one quart of canned ones, one small onion, one bay leaf, one stalk celery, one sprig of parsley, one teaspoonful sug-ar, two level tablespoons butter, four level tablespoons browned flour, one-half cup of milk. Put the tomatoes in a saucepan with the onion, bay leaf, parsley and celery; let it stew about 10 minutes. Press through a sieve.



SUCCESSFUL TOOLS

These Chisels have carved their way to fame. To-day, those who know tools pronounce the Keen Kutter the perfect Chisel Success. Tempered nearly to the handle; hand whetted; sharp and ready for use; handles of selected white hickory with leather heads.

KEEN KUTTER
QUALITY TOOLS

are *all* successful tools—tools that have won their way by hard, honest, true work. Every step in their success has been reached by sheer force of *merit and quality.* Keen Kutter Tools include—Saws, Chisels, Bits, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Pocket-knives, Screw-drivers, Files, Pliers, Glass-cutters, Ice-picks, and a full line of Farm and Garden Tools. Williams' Shaving Soap

HARD-WORKING farmers usually have strong, wiry beards, and need the best shaving soap to soften them. Ordinary soaps only smart, and irritate the face and sometimes poison it. Williams' Shaving Soap softens the beard in a wonderful way, and leaves the face soft and refreshed after shaving.

THE J. B. WILLIAMS CO'S BARBERS' BAR SOAP

"The only kind that won't smart or dry on the face."

Send 2c. stamp for a TRIAL CAKE of Williams' Shaving Soap, or 4c. for a Williams' Shaving Stick, trial size, enough for 50 shaves. Address
THE J. B. WILLIAMS COMPANY
Department A, GLASTONBURY, CONN.

Why doesn't Genasco Ready Roofing dry-out, crack and let the water in, like roofings made from coal-tar and other residual pitches?

Simple enough. Oil is the life of ready roofing—as it is of harness-leather. So long as the oil stays in, the roof is waterproof. If the oil evaporates, the roofing becomes brittle, cracks, and lets the water in.

This is why these pitches do not make good roofing. Their oils dry-out quickly at ordinary temperature—you know how soon tar-paper gets brittle.

Genasco Ready Roofing is made of natural Trinidad Lake asphalt—abundant in natural, permanent oils which do not evaporate in the hottest summer weather. Genasco does not become brittle; Genasco does not leak.

Anybody can lay it. Smooth or mineral surface. Several weights. Nails and cement for laying are packed inside each roll. Sold by the most progressive dealers everywhere. Write us for Book 35 and samples.

Bees and Their Care

BEES AND FRUIT GROWING.

LET us now look upon the other objection to the culture of bees in connection with horticulture, the depredations of bees upon friuts. I think that if it can be shown that the bees prey only upon damaged fruits, and this only in exceptional circumstances, the verdict will be in their favor, for damaged fruit, when hanging upon the trees or the vines, is of but little value.

If not harvested at once, it will rot, so the bees gather only that which would be soon wasted. But do the bees damage ripe fruit, which is sound? An examination of the mandibles of the bees in comparison with those of many of the hornets and wasps reveals the fact that while those of the hornets are like saws, the mandibles of the bee are rounding and barren of teeth.

The bee's jaws act from side to side instead of up and down as in the animal's, and they are shaped like spoons. They can grasp objects, or the stems of plants. They are made to manipulate soft substances like beeswax.

The bee can make a hole in cloth or in paper, but an examination of the method used will show that they first take hold of a projecting thread and pull it out, then take another, and keep pulling till they change an apparently smooth piece of goods into a rag. But when it comes to the smooth skin of a fruit, all they do is to remove the soft down or bloom of the fruit, if they travel upon it long enough, but they are no more able to bite into it than a human being could bite into a smooth plaster wall.

This may be demonstrated by actual test. The most expeditious method is to place a bunch of ripe grapes inside of a populous hive of bees, previously puncturing a few of the berries, and taking note of it. After twenty-four hours or more, investigation will show that the bees have sucked the juice out of the punctured grapes, but have left the others intact. They will even go so far as to cover these with propolis, or bee glue, as they do with every foreign substance of which they cannot get rid.

Some persons assert that they are sure the bees injure fruit, because they have seen them at work upon it, and because large quantities of fruit, especially of grapes, have been found entirely destroyed where bees alone were found upon them. This is simply a delusion similar to that of the uninformed human being who denies that the earth turns around the sun because he sees the sun rise and set and does not feel the earth turn under his feet, and argues also that it would be impossible for him to live and hang on, when the earth was bottom side up.

The bee evidently works upon the damaged fruit, and feels so innocent about it that it does not even fly away when we catch it in the act.

But let us get up with the dawn, before sunrise, and go to the vineyard or to the peach orchards, and there we will catch the real culprits who damage sound fruit; quails, robins, catbirds, etc. They gather there by the hundreds, they eat their fill, and when no longer hungry, they find a pleasure in wantonly plunging their beaks into the soft fruit.

In many instances you will find a bunch of grapes with hardly a sound berry, and they are all plucked on the same side, many of the berries showing two holes, one above the other, a short distance apart. It was done by the two points of the bird's beak.

But the sun rises above the horizon, and the bees come to gather the fragments, and so does man, and he straightway puts the blame on the little industrious toiler who works from daylight till dark for its board and never fails to bring its harvest to the hive, to be later robbed by this complaining human miser.

Bees do not work at all times, even on unsound fruit. Is it because they are lazy at times? No! it is because they find something better.

Whenever you find the bees in damaged peaches or grapes, you may be sure that there is no honey to be found in the blossoms.

There are seasons of honey scarcity, when they manage to gather quite a supply of partly-fermented fruit juice. It is the best they can find, but it is not very good for them, for it will turn sour in the hive and make bad winter food.

The prudent apiarist removes all this unhealthy food from the hive before winter and gives them good honey instead. There is never any great quantity of fruit juice harvested, because in many cases the bees are made drunk by its fermentation and fail to reach the hive alive. So when bees are seen to feed numerously upon damaged fruit, it may be safely asserted that the apiary is more injured than benefited thereby.

I have shown that the damage caused by the bees is more imaginary than real. Let me now look upon the damage which has been occasionally inflicted to the bee by the horticulturist. It is done by injudicious spraying of fruit during the bloom.

Dealers in spraying instruments have formerly asserted that it was necessary to spray the fruit trees while they were in bloom. The result has been a wholesale poisoning of honey-gathering insects wherever this method was pursued; the poison in the spray mixed with the honey in the corolla has endangered not only the life of the insect that sipped any part of this liquid, but also the life of those who might eat of this honey in the comb. So the spraying of fruit in bloom may easily be made a criminal matter.

But is there any advantage in spraying fruit trees in bloom? What we seek to prevent is the puncturing of the fruit by the predatory insects, such as the codling moth, the curculio, etc.

These insects puncture the fruit only when it is formed, and their destruction must follow the formation of the fruit. The throwing of any poisonous mixture upon a blossom can have but one effect, that of distroying the efficiency of the pollen, if it becomes diluted in this poison.

The assertions which I have made in this paper are based upon positive facts I have been a beekeeper on a large scale for some forty years, and have grown peaches, apples and grapes also on a large scale. I have some twelve acres of vineyard in full bearing, and during the past summer also harvested, in partnership with my son-in-law, some 1200 baskets of fine peaches. I have often taken visitors into the vineyard and shown them without possibility of error that beekeeping and fruit-growing are not antagonistic, but are profitable when carried on, hand in hand, in a suitable location.—C. R. Davis.

Coulson's Special Dry Chick Food

Feed to Your Chicks

And See Them Grow

Advantages of Coulson's Ready Mixed Chick Feed

The proper feeding of poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

Chicks should be given a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are best adapted to give nourishment to the growing chicks: Sweet tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other things.

It is clean, sweet feed that is easily digested, and chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks, at a cost of about 4 cents apiece.

Ask your feed dealer about Coulson's special and be sure that he does not sell you something else.

If your dealer does not keep it, write us, and we will tell you where and how to get it.

To be able to raise the chicks that you hatch and have early broilers to SELL AT A HIGH PRICE; to raise NICE LARGE HEALTHY CHICKS; to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Coulson Poultry & Stock Food Co., Petaluma, Cal. Milwaukee, Ore.

Gentlemen:—

While in the poultry business I have tried several brands of Chick Foods and find COULSON'S SPECIAL far superior to any other brand.

Yours truly,

(Signed.) Floyd W. Scott.

Farmer Smith's Gas Engine

Said Farmer Smith to Farmer Brown,
I think I'll hie myself to town,
And buy straightway a new machine,
To run my pump by gasoline.

So Farmer Smith he hit the pike,
And to the trolly-line did hike,
And quick as lightning in he came,
And landed saft at Sixth and Main.

Of engine men he met a score,
They dogged his steps from door to door,
And every one was quick to swear,
That all but his would need repair.

But while he sought to find a "cinch,"
A salesman nailed him inch by inch,
And ere the day came to an end,
A new machine possessed our friend

But when at length it was installed,
Poor Smith was terribly appalled,
For when he saw all he must learn,
To make that engine do its turn.

Then Farmer Smith just cussed and swore,
And tramped the wheels 'till he was sore,
He fussed around from dawn 'till dark,
That blamed old thing refused to spark.

When quite discouraged with the strife,
A friend inspired new hope and life,
He said if you would be in clover,
Secure, like mine, the best, A STOVER.

Live Stock and Dairy Edition

California Cultivator

Los Angeles March 28, 1907 San Francisco

Modern Stock Barn and Feed Yard

IN THE northern and central portions of California, the dairymen and feeders are building their barns with two objects in view: first, sanitary excellence; second, practical regulation of feeding bins and yard privileges.

Sanitary conditions properly come first, for it is a fact clearly demonstrated by experience, that cows will not do well in poorly ventilated barns, nor in confined places where the floor is continually wet and filthy. Cattle improve or decline according to their environment. Clean, open sheds, protected from rain, where the roof is of sufficient length to keep the floor dry, are best.

Yards constructed to permit of moderate exercise are also now used by dairymen; the reason assigned being, that the more exercise the animal takes, the greater will be the breaking up of the tissues of the body; and as this is the source from which the curd is derived, it follows that wide ranges are not conducive to the production of butter fat in milk, while clean yards, clean sheds, ample ventilation, and wholesome feed, bring best results.

The above illustration presents a modern stock barn and feed yard for a California dairy. It has ventilation, concrete floors in the barn, and a gravel base for the yard surrounding the barn. The space between feed bins may be filled with alfalfa or hay, which expedites feeding, or wagons may be drawn through the barn and the stock fed directly from them. The illustration represents the style of a popular barn being erected in many sections of the San Joaquin valley. H. V. Taylor of Corcoran has a number of them, or similar ones, and his stock always presents a healthy and animated appearance. The length of the barn commonly is 100 feet, the width 50 feet, with a 20-foot driveway in the center. The roof extends well down the sides so that no rain reaches the cows, and very litle wind comes through. The cement floor is sanitary, as water runs away behind the animals to a gutter under the eaves of the roof. Sanitation and ventilation are the primary conditions to be sought in the erection of cattle barns and yards.

Confident that a trial will convince any one of its superior merits, we will send to new customers one 25-lb.

$3.00 PAIL FOR $2.00

or one 50-lb. $5.75 double sack for $3.50, and will prepay the freight to any point west of the Rockies. Not more than 50 lbs. to each one, and we reserve the right to withdraw this offer without notice when we have received all the orders we care to fill at these very low prices.

We are presenting no cheap premiums nor offering any gaudily colored pictures, but are making this strictly legitimate business offer for the purpose of inducing many more to try WEST COAST STOCK FOOD. We thus hope to add to our large number of steady customers. We are charging up the difference and the freight to our advertising account feeling sure that a trial of the goods is the very best advertising.

There are no strings to this offer. Just send us your name, your post office address, the freight station to which you want the goods shipped, mention this paper, and we will do the rest. Send money order or check with your order, and if everything is not exactly as represented your money will be refunded. The First National Bank of this City, or Bradstreet's Agency, or any leading firm, can inform you as to our reliability.

West Coast Stock Food

Beyond Question the Best Condition Powder Made

Our Trade Mark

Long a Familiar Sight Hereabouts

A purely vegetable compound, very strong but harmless, and may be fed to calves, colts, lambs and pigs, without fear. It will make young stock grow and develop in a rapid yet natural way, while matured stock will maintain health and vigor by its regular use. It purifies the blood, tones up the system, acts on the digestive organs, enabling the animal to assimilate all of its food and convert the same into blood, bone, fat, sinew and muscle. Hence it is a great feed saver. It puts the system in proper shape to be sustained and developed in nature's own way. Its use avoids all tendency to tuberculosis. And besides being a general conditioner, this preparation is a cure for **Epizootic, Cough, Hidebound, Distemper, inflammation** of the **Stomach, Caked Udders,** and all sorts of **Colds,** etc. Specific directions in each package.

Your stock needs a condiment just as you need salt and pepper—they relish the food better and digest it better. Read what a leading professor in a prominent agricultural college, in a recent article on Stock Foods, says:

"They will always be found useful when properly made. The time will never come when intelligent feeders will cease to use them. The necessity for using them and the advantage therefrom will become greater as foods become increasingly dear. Whether it will be profitable to feed them will depend upon the necessity for using them and on their cost. My special desire, however, is to show that they have a place in the economy of intelligent feeding. The question of price must be fought out between buyer and seller."

The best is always the cheapest. A dollar's worth of **West Coast Stock Food** will go further and produce more and better results than will two dollar's worth of many so-called "stock foods" which contain a large amount of cheap filler. **West Coast Stock Food** is highly concentrated and therefore less needs to be used. Why buy stuff shipped over the Rockies at high freights, when better goods, better adapted to these west coast conditions, are made and sold right here at lower prices. **West Coast Stock Food** has been a standard preparation upon this west coast for many years. It is the result of long, careful, and intelligent experimenting and study on this west coast and under its peculiar conditions.

MERCEDES JULIP'S PIETERTJE, H. F. H. B. 39480.

This is a photo of a Holstein cow of international fame because of her marvelous recordas a butter producer. In seven days, in a Minnesota mid-winter,she made 584 lbs. of butter, thus becoming the **Official World's Champion.** She was then owned by the present**President** of the **West Coast Stock Food Company.** It wasonly by recognizing and applying the principles of feeding weare now seeking to emphasize that this remarkable record was possible. This cow was bought for $200 and in less than eighteen months she, her heifer and her bull calf were sold for $3700. It pays to take the best care of stock as well as to feed them intelligently.

West Coast Stock Food fed to **Horses** and **Mules** will make their coats smooth and glossy, impart a vigor and "go" which enables them to render more and better service. For **Cattle** it is unequaled; it promotes assimilation of all the foods they consume and hence a strong flow of pure blood. We cannot expect them to put fat on their backs and ribs or into their udders, or to produce large, strong, healthy calves, unless the system is kept in good condition. The judicious use of this great conditioner will do much toward making the business of **Sheep Raising** more profitable. It causes sheep to gain in flesh, and given to ewes for one month before lambing time will improve their condition and increase the flow of milk, so that the lambs will be much larger and better every way. And for **Hogs** it is equally valuable. Their digestive organs have been overtaxed for generations. This food aids their digestion, purifies the blood and supplies many of the lacking natural ingredients of a perfect ration. Try it with hogs and note how rapidly they grow.

But don't take our word alone for all this. Read what other have said.

We hate to put this picture in here, because it isn't a bit pretty, but we want to show you what this calf looked like at 11 months old, before it had been given any West Coast Stock Food, and then have you read what its owner, Mr. Langstaff, says:

West Coast Stock Food Company: Elsinore, Cal., May 2, 1904.

Dear Sirs:—I have been in the cattle business for a number of years, always weaning the calves and feeding them skim milk. It is hard to keep their bowels right. We had two or three, as we thought, very good remedies. Last fall we had two calves that we could not cure, but we kept them alive for several weeks with our remedies. An old friend called on me and seeing these calves, he advised me to try West Coast Stock Food. I did not think it worth while as they were lousy and their skins stiff and scabby. There is no doubt that they would have died in a few days. I am glad to say I tried the West Coast Stock Food. **One package saved the calves,** and they have improved ever since. I am feeding twenty-three at the present time. I keep the West Coast Stock Food on hand and feed it regularly, and they have not been bothered with scours. Our best investment is what we put into West Coast Stock Food. Respectfully.

LANGSTAFF & WALTERS.

A Few Out of Many:

J. J. Thornton, Los Angeles, writes: "I am using your Stock Food and consider it the **best on the market** for colts and horses out of condition."

I. C. Milhous, Van Cleve, Iowa, writes: "As a blood purifier and all round condition powder, I know of **nothing better** than your stock food."

F. S. Rogers, Van Orin, Ill., writes: "For a blood purifier and to put the horse in good condition, it **fills the bill** and cannot be beaten."

J. B. Myers, Pasadena, writes: "I believe there is **nothing better** of its kind."

Stock Raising in California

A General Resume of Conditions and Practices Conducive to Success on the Pacific Coast

By MINNA E. SHERMAM

CALIFORNIA possesses wealth in her great timber lands, fully as great a source of wealth in the mineral and oil-bearing strata. Hardly second are great stretches of land planted to orchards and vineyards, and side by side with the horticultural wealth, stands the stock raising interests of the state.

The Stockman's Domains.

The stockman is in some portions of the state giving place to the dairyman. A few years ago the leading cattleman of the San Joaquin valley made it his boast that his vacqueros could start from the ranch on the Mexican line and drive a bunch of steers to San Francisco and feed them every night on his own land.

It requires an intimate knowledge of the great valleys of California to realize the magnificent domains held by the cattle men. There are thousands of acres of land, not even irrigated, that merely wait the time when the population of the state will have increased, until the land becomes too valuable for irrigated farms, to be used to feed one beef on two acres.

Already the cattle men are planting alfalfa by the hundred acres to feed the cattle. The cows no longer walk miles to secure a full stomach during the summer time. Before alfalfa was planted the sun dried up native grasses and the heat rose up in dust spirals, while the cattle lowed longingly at the dim outlines of the mirage of a distant lake with wooded shores that lay low on the horizon.

Beef Cattle.

The beef herds of California today are grade cattle; the native cattle, or Spanish longhorns, are confined to the hill settlers, there to rustle a living on grass or by browsing over the low bushes. The great beef herds have been improved by the addition of high bred sires of Angus, Hereford, and Shorthorn breeds. While the feeding of the steers is often deficient, the blood tells in raising the standard of beef above that of the native bronco cow.

Horses.

The early importation of thoroughbred horses has stamped their marks on the driving horses. In the days before the coming of the trolley cars, the type of the thoroughbred was clearly seen in many of the small horses drawing the street cars. This early infusion of thoroughbred blood has given stamina and good bone to the common horse of the country. The famous stables of racing horses of Governor Stanford, Haggin and other magnates, cannot be more than mentioned here. In the days when Mr. Marvin was at Palo Alto, I was a frequent visitor, and knew personally many of the famous racers, seeing them begin in the kindergarten ring and develop into the full power of speed.

Draft Horse.

The lack of good roads and well paved streets in the cities, as well as the absence of manufacturing, kept back the breeding of heavy draft horses. During the past fifteen years there has been a remarkable growth, of towns into cities, and of villages into towns. Now there is an active demand for draft horses. The importation of draft stallions has become common; today ten or fifteen may be found where fifteen years ago one represented all the available stock within a farmer's reach.

Kern county has lead in the raising of heavy horses; the buyers taking carloads of large horses to the town for use of the draymen. Here the San Francisco Fire Department has purchased many useful horses. San Francisco has lately been drawing heavily on the San Joaquin valley for large horses. The available supply of geldings is now limited, and far too many mares are being taken away from the breeding strings of the farmer to do draft work; these are lost as producers in the turmoils of rebuilding San Francisco.

The Plains.

The heavy horse is naturally found on the plains or in the wide valleys. In California there is a popular notion that the hill horse has better

Martha Washington.

The illustration herewith given is a grade Jersey cow. The record made in five months, from calving, was 48 pounds of milk per day. She has a test of 20 pounds at one milking of 5.2. While this performance is exceptional, there are many examples of a somewhat lower test made by grade Jerseys throughout the state,

feet and is hardier than those raised in the valleys. While this may be so in the driving and saddle horses, yet the heavy horse succeeds best on the plains.

The Arab is a horse of the plains also; from him comes the thoroughbred. With perhaps, the one exception of the Morgan horse of New England, the best strains of horse flesh come from the plains. The Morgan horse, like other hill-bred animals, lost in size. There may have been lack of wisdom in the breeders to control this decline, and today the best of the blood has been infused into the standard-bred trotters.

The Morgan horse of today is a different animal from the enduring kindly Morgan animal of thirty years ago. His Arab-like fondness for his master, and for the children, that made him a docile pet, yet mighty to go on the road,—has been lost in the shuffle of making a racer out of the best family horse the country ever produced.

Dairy Cattle.

The breeding of blooded cattle by the dairyman has developed within the past twenty years. The improved blood was first introduced to increase the butter fat contents of the milk and to increase the daily milk yield. The introduction of the dairy sire too often, when bred to cows of beef strain with improved feeding, at first produced a loss. The richer foods made many cows put the fat onto their backs. The beef blood was still too strong an infusion.

This was for a time a source of great discontent with the purchasing of fine dairy sires. The dairyman wished to increase the daily output of milk and raise beef at the same time. He failed, and had only himself to blame, for he selected as dams his best beef cows. The cows that looked best to him, and his ideals of a cow, were along beef lines, so he selected his best beef cows as dairy dams.

Their pretty rounded sides and easy keeping qualities, appealed to him as desirable. Later came the knowledge that the dual-purpose cow did not exist, and that the milk a cow gave was of more value than her carcass could be for beef.

Gradually the lean cow or "widows," as the stock boys call them, were found to be the most profitable cows in the bunch. That reminds me of a story; maybe you have all heard it? The preacher read from the Bible the description of the lean kine of the seven year's famine; it caught the ear of a sleepy dairyman as he dozed in his pew, one warm Sunday morning; up he jumps and startles the congregation from its napping by shouting, "Say who's selling? I'll take the bunch." It has been suggested these lean cows that swallowed the fat kine were the ancestors of Governor Hoard's type of dairy cow.

Registered Cattle.

The full blooded herds of dairy cows in California are usually Jersey or Holstein-Friesian. There are a few Ayrshire and Guernseys, and one of two small herds of Brown Swiss, that make the fancy herds of the state. The common herds are bred up from the Shorthorn base by use of a dairy sire of one of the established butter breeds.

The distribution of the breeds has been governed largely by the character of the land and the natural foods produced. Individual fancy often brings a race of cattle into unsuitable environments, they fail to prove profitable and pass to more congenial conditions.

The natural herbage of the coast, supplemented with rye grass, supplies the pasture; here the Jersey and Guernsey find a home. The Ayrshire is also a hill cow and can run up a steep hill like a deer, never halting until the highest point is reached. The Holstein and Shorthorn are at home on the plains, in alfalfa field and on salt and Bermuda grass.

Alfalfa.

In the legume family, of which alfalfa is one, the protein is large, making it a nitrogenous food, similar to meat for the human family. The chemical analysis shows it to be the equal of bran in protein, a little less in carbohydrates.

Now protein is the expensive part of food, and to have a natural food, that is full of it, is a blessing. Many eastern feeders have been claiming that to class alfalfa with bran was giving it too high a value. Alfalfa meal has been a disappointment to the dairyman; the poultry feeders speak highly of it, however.

Alfalfa that grows without having rain fall on it, cured in the snock and cut while juicy, retains its leaves cured, not dried up; in other words, cow hay; makes it perfect and different from the reedy, sunburnt stuff that is sold for alfalfa hay.

I have for years subsituted chopped alfalfa hay in the cow ration to take the place of bran whenever the bran becomes too high or the price of butter fat drops down. The cows have held up in their milk steadily when the change was made slowly and carefully.

Every change that comes in a cow's diet should be made slowly or they will eat the new mixture with a rush, and have indigestion. Bran has

This is Where the Hard Work is Done

and this is where some spreaders give you trouble. It's easy enough to build the front end of a spreader—the front end is a *wagon*; the back end is a *machine*.

In SUCCESS Manure Spreaders

28 years' experience insures no trouble at the business end. Twenty-eight years has eliminated the trouble-making things.

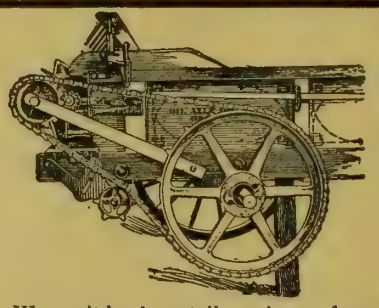
We tried gear drives—they won't do. We saved you the trouble of trying them.

We tried smaller axles—they won't stand the strain.

We tried all woods for the frame and have settled on second-growth white ash.

Look at that cut again—See the heavy iron brace from the beater end to the driving axle. It removes all strain from the end of the body and makes the cylinder run freely without binding.

See the big driving wheel and the chain—that's a steel-pin chain—the only kind that will work satisfactorily.



We can't begin to tell you in an advertisement all the good points in SUCCESS Spreaders, but when you get ready to buy a spreader do three things.

First—Write for our spreader book. It tells plainly and truthfully about SUCCESS Spreaders. It will start you right in the selection of a spreader It will be a standard to guide you in examining others.

Second—When we send the catalog we tell you who sells SUCCESS Spreaders in your locality. Go to that dealer and see one. Examine it thoroughly Compare it with others.

Third—And most important of all—Go to some man who has used a SUCCESS for a few years and ask him what he thinks of it.

Do this and you will have Success with your manure spreading

MOLINE PLOWS AND OTHER FLYING DUTCHMAN FARM TOOLS

WILL NOT STRIP THE BRANCHES

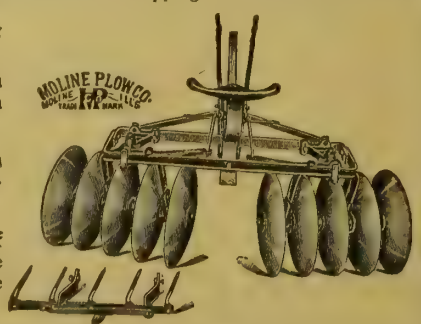
The Moline Reversible Disc Harrow is an ideal tool for orchard cultivation. The frame is built down close to the discs making it lower than any other harrow of its class; the levers are short and always in the center, making it practical to work under low hanging limbs without stripping the branches.

The harrow is all steel and iron excepting the pole.

The discs may be reversed in a moment without taking them from under the frame.

The gangs may be tilted by a simple adjustment of the malleable frame spreader.

Bearings have a double set of wood blocks, giving twice the wearing surface to meet the end thrust.



For Orchard Work the Moline Reversible is equipped with an extra long frame instead of extension head.

The correct design, great durability, ease of handling, low build, arrangement of levers and adjustment for setting the gangs in and out on the frame makes this an all around harrow. Protected by patent. Made in four and five foot, 16, 18 and 20-inch discs; four and five foot, 16 and 18-inch cut out discs.

Before buying a Reversible Harrow ask your dealer to show you the MOLINE.

Send Us Your Name and Address, enclose four cents in stamps to pay postage and mailing, and we will send you our FLYING DUTCHMAN SONG BOOK and Junior Catalogue Combined, containing Twenty-six old Familiar Songs with words and music.

Moline Plow Co., Moline, Ill.

Deciduous Fruit Culture

By J. W. MILLS

CARE OF YOUNG TREES.

THOUSANDS of young trees will be planted this spring and peaches will perhaps constitute the largest percentage of any variety planted. Peach trees are very apt to sunburn if not properly protected from the sun the first year. When a young tree especially, becomes sunburned at any part, it is a sure thing that it will be attacked by borers almost if not at once. When once they enter the bark, they are apt to go clear in and do much damage before they are noticed.

Borers will not attack healthy wood. (We refer to borers that burrow above ground in the stems and branches. If the bark is kept in a healthy condition, there need be no trouble from this insect. We have killed a numerous crop of these borers in Bartlett pear trees, even after the worms had entered the bark, but it is not safe to allow them to go that far.

It used to be a common practice to wrap the trees with old sacks till the stems had grown a rough bark, leaving the sack to rot off. This is a good thing to do, but whitewashing is cheaper and just as effective. A little sulphur added to the lime, say a handful to a 3-gallon pail and the same amount of salt, will make a whitewash that will stick. The sulphur will be distasteful to any insect, though the object in using the whitewash is to prevent sunburn. If there is no sunburn there will be no limb or trunk borers.

Mr. J. B. Neff, of Anaheim, uses a whitewash for general purposes that sticks about as tight as paint. He mixes lime with cactus juice instead of water and salt.

Should borers succeed in hatching on the trees, they will easily be detected by a small irregular mark just beneath the bark on the sunny side of the tree. By lifting the thin outer bark, the small worm will be seen, not much bigger than a hair. In such a case, it is time to act at once. Often soft soap made from yellow bar soap and thinned down to the consistency of thin cream and apply with a brush and cover this with anything, paper that is not black or old sacks, and the worms will never do any harm. This is not theory, but has been done repeatedly on a large scale and with entire success.

LEAVES AS FERTILIZER.

Leaves are nature's fertilizer. Some one, in speaking of the importance and usefulness of leaves, said that they were the lungs of the trees and plants. It is certain that vegetation is fed, nourished and sustained by the elements contained in the atmosphere as well as by those of the soil. Therefore the leaves of each tree or plant possess the elements obtained from the air and earth particularly adapted to the sustaining and nourishing of its own peculiar life.

How often have we heard the expression, "I dislike autumn, for the leaves are falling—they are dying." To some the fall of the year brings unpleasant memories, as probably this is the season of the year when their loved ones passed away; but the falling of the leaves should not be a sad sight, but a gladsome one; because they are simply passing from one state of usefulness to that of another. They are doubly useful; they protect the roots from the severe cold and the injury of the frequent freezing and thawing of the ground, and while thus employed they are decomposing, and the rich properties that they gathered from the air and soil enter into the earth and are absorbed by the roots, and thus leaves live again.

Tobacco leaves pulverized and sprinkled on the top of the soil of potted plants not only furnish food for the plants, but are also a preventive against those little white worms which are so troublesome and destructive to plants. Everyone who cultivates house plants knows that in order to keep the plants growing and blooming nicely the seed pods should be removed as soon as the flowers fade, and the leaves removed as soon as they begin to die or turn yellow. Instead of throwing these leaves and pods away, as is the usual practice, press them into the soil containing the plant from which they have been removed. Plants treated in this way seldom need to have their soil replenished.

FRUIT AND FROST.

The recent cold weather has killed a great many fruit blossoms that gave promise of making fruit. It is not at all certain that this is true in every case where even the entire crop has disappeared. It has been the experience of many growers that certain varieties of peaches, for instance, have passed through frosts that have killed the fruit of all other varieties. This has occurred under our observation with Levy's Cling and Salway peaches. These trees bear continually under the most trying circumstances. It would seem that frost would have the same effect on the embryo peaches of these varieties as it has on the others, but the vigor of them seems to come into play against the frost. If these are facts, then how do we know but that the frost is not altogether to blame. Trees that are constantly kept in a thrifty condition have the maximum periods in which to store up food material. This is the reserve force that resists the elements and natural enemies of the various fruits. Certain varieties are minus these qualities to a certain extent and therefore cannot be relied on. Persons having locations that are subject to severe frosts at critical times in the life of the fruit crops, should select varieties that are naturally hardy in every respect. These remarks have special bearing on selecting for the home use. We know of home orchards that are sometimes without certain fruits on the account of the late frosts. There are varieties that will stand in such places.

TIME TO GRAFT.

It is now time to get grafts into plum, pear and apple trees. It is too late for peaches and apricots. Except where branches are over two inches in diameter, splitting the stump is a good way, but for branches larger, the saw graft is best. This is made by sawing across the corner of the stump so that the saw cut will extend down the side. Trim out with a grafting knife, so that the top of the groove will be wider than the bottom and press the scion down from above. Wax with a brush, wrap with cloth and wax over this. Do not use a scion larger than a lead pencil nor one with less than two buds nor longer than three inches.

CALIFORNIA TUSSOCK MOTH.

As this caterpillar is a native of California, we might expect it to have parasitic and predaceous insect enemies, as well as diseases.

Some experiments were undertaken with the idea of determining these as far as possible. The method of procedure was to collect specimens in the field at various dates and stages of development and keep them for the remainder of their period of development in muslin-bag cages tied over apple branches. It was thought that this would prevent any infestation by parasites after the date of collection.

There were in all fifteen of these experiments, the dates of collection ranging from March 24 to April 26. The data obtained are embodied in the table below, from which it will be seen that no parasitization occurred until April 11. All the collections made after that date contained parasitized larvae.

The only parasites obtained in these experiments were Tachina flies. These parasitic flies resemble in general appearance the house fly, but most of them are larger.

In addition to the collection of larvae, a number of collections were made after spinning-up had occurred. These were kept in paper bags in the laboratory. All the pupa collections showed a liberal percentage of parasitization, in some cases as high as fifty per cent. The majority of the parasites taken were the same kind of Tachina flies obtained from larvae, but the pupa collections also showed several species of Ichneumon flies and other parasitic wasps.

There is also a Chalcid parasite which develops in the larvae and kills them before they reach the spinning-up stage. In this case the parasitized caterpillar remains fastened to the leaf or twig on which it dies and the adult larvae of the parasite emerge from the caterpillar and pupate in a row on each side of the paras pate in a row on each side of the parasitized insect. Twenty to thirty parasites develop from a single larva

There is but little evidence of predaceous insect attack on this caterpillar or of it serving to any extent as food for birds.

The eggs are attacked by a minute hymenopterous parasite (Telenomus orgyiae Ash). This looks like a very small gnat, and is found crawling over the egg masses. The larvae of this parasite develop within the egg of the tussock-moth and begin to emerge early in the spring. The emergence of the parasite continues, however, until after new egg masses have been deposited.

The egg masses are also attacked by the larvae of a Dermestid beetle. This larva is brownish-colored and covered with long hairs; it is able to crawl rather rapidly, but may remain still if disturbed.

The egg parasite and the Dermestid beetle are the most useful parasites of the tussock-moth, as, by attacking the eggs, they prevent the caterpillars from hatching, the efficiency depending on the abundance of the parasitization. The other parasites attack the larvae only after they have developed and completed their injurious attacks on the fruit and leaves.

While parasites have been very abundant they have not destroyed more than fifty per cent. of the caterpillars, many moths having emerged and deposited their egg masses. So, if the egg parasite and Dermestid beetle do not become much more abundant, or some other cause of death intervene, there will be a liberal infestation of the orchards again next season.

Diseases were scarcely at all in evidence among the larvae. A few larvae died early in April, apparently from a bacterial disease, but caterpillars forced to feed on leaves wet with water containing an infusion of the dead bodies did not result in infection. Three of these experments were tried.

DEPTH OF DEATH VALLEY.

The United States Geological Survey has just completed a line of spirit levels through Death Valley, California, and much to the surprise of everyone familiar with the region has ascertained that the depth of that area is not so great as was supposed. The final computations of the results have not yet been made, but the preliminary figures give for the lowest point a depth of 276 feet below sea level. Bennett's Well, which is near this point, is 266 feet below sea level. These figures may be altered by two or three feet, when the final computations are made, but they are probably not more than three feet in error. The Geological Survey now has elevation marks on the highest and lowest points of dry land in the United States.

It is a strange coincidence that these two extremes are both in Southern California and only 75 miles apart. Mount Whitney is a foot or two over 14,500 feet above sea level, while Death Valley, as above stated, is 276 feet below. Before the Salton sink, also in Southern California, was flooded by the Colorado river, it contained, the lowest point of dry land in the United States, a spot 287 feet below sea level.

Previous estimates of the depth of Death valley based on barometer readings gave for the lowest point figures varying from 250 to 450 feet below sea level. The level line of the Geological Survay is believed to be the first accurate determination of elevations in that locality that has ever been made.

TEST FOR MUSHROOMS.

The popular idea is that most fungi are poisonous. The truth is the exact opposite. Those that are poisonous contain a principle known as "muscarine," which is practically identical with the poisonous property in decayed meat. The popular test of peeling is not a reliable one, for some poisonous sorts peel readily. Nor is appearance a guide, for the ugly greenish-yellow Boletus Edulis, which most people would shy at, is excellent.

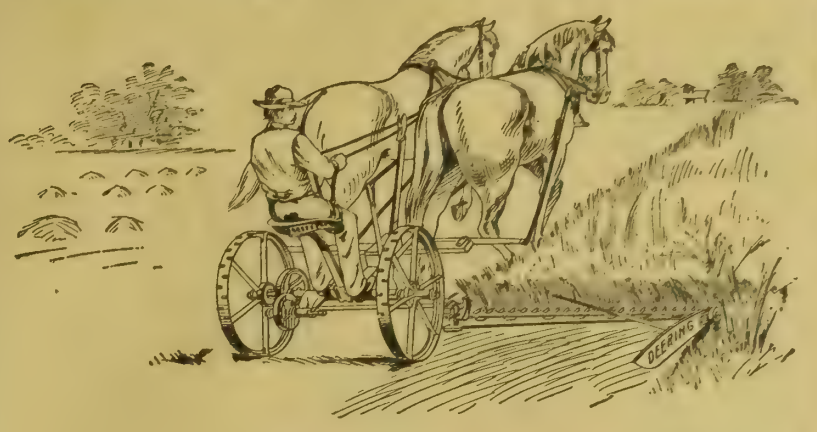
Practically, all those which become brownish, greenish or bluish when cut and exposed to the air are unwholesome.

There is more than one kind of edible mushroom besides the Agaricus Campestris or meadow mushroom. The St. George's mushroom, found in May, is good eating; so are the parasol mushroom and the scaly mushroom.

The giant puffball, which is white all the way through, forms an excellent dish when delicately fried; and the beefsteak fungus which grows on trees is almost as good as the meat from which it takes its name.

To the trade there are three sorts of mushrooms known—namely, "buttons," "cups," and "broilers." France is the cheif center of mushroom culture, the annual crop of mushrooms grown there being worth over $2,000,000.

Deering Ideal Mower



It is time you were thinking about the mower you will need this season. Of course you want the best—that means the Deering, for the Deering **IS** the best. It is the lightest draft mower made; is simple and durable, with few points to wear or get out of order. It cuts from the start in the heaviest grass or grain. It's just what you want. We have a few of these machines on hand now and expect to have more soon, but the railroads are very slow in delivering freight from the East and it will pay you to buy now—and be sure of having your machine when you want it. We have the Deering self-dump rake, too, and there is nothing better.

With the Citrus Growers

By J. W. MILLS

PACIFIC COAST FERTILIZERS.

IN THE past, the great bulk of fertilizers used on the Pacific Coast, have been imported from foreign parts or for a considerable distance east of the Rocky mountains. This will no doubt continue for a great many years, and it is doubtful if we ever can find a supply of potash in large and concentrated form. It is a fact that our soils are rich in potash, but it is also true that the plants cannot always get it in sufficient quantities to supply their needs. Is it possible for the fruit growers, and especially the orange growers of California, to dispense with the importation of commercial fertilizers? Theoretically it is. If such is the case in a practical way, and if the growers work out the problem, will they not stand at the head of their class in scientific farming and fruit growing? And above all, does not the mention of such an idea smack of much self-assurance, not to say irrational thinking? We think it does, but there is one thing sure, we have not many years left in which we can draw on the nitrate beds of Chili, for the firms who control them say that the visible supply will be exhausted in fifty years. The principle source of our potash is from the sulphate beds of Germany, situated many hundred feet below the surface of the ground, and there is nothing so uncertain as buried treasures. When the lead runs out, that is the end to that particular deposit.

Our chief source of supply of phosphoric acid has been from the natural rocks of the country contiguous to the Atlantic coast. This requires a long haul that means a high freight charge and is prohibitive, except when reduced to the double phosphate form. It is seen by this, that with the exception of a small amount of the three fertilizing elements that we need to add to our soils for quick results, we have to deliver by long hauls.

It would seem that the farmers of California would have to resort to some magic means to get these high-priced materials from their own territory, or else continue to pay high prices. There seem to be opportunities to relieve this condition. The copper companies of the west have a surplus by-product sulphuric acid, and in an endeavor to utilize this, they have explored some of the Pacific islands and found rock prosphate in abundance. This they have attempted to put on the California market as a super-phosphate after having treated it with acid, and just what the result will be has not yet been determined. At any rate it is a phosphate close to home. That may settle the phosphate question, but we have no potash deposits that we know of, except the relatively small amounts that are distributed in the soil, but which have so far proved inavailable to plant life in most cases. If it is not available and cannot be made so, it might as well not be there. The problem is to make it available. If it can be done, the potash problem will be solved for generations to come. The key to the problem in all probabilities is in the hands of the farmer. Striking instances have been related where analyses of the soil have shown that barren clay soil in which no profitable crop could ever be persuaded to grow, contained more plant food than rich garden loam that produced abundant crops year after year. Why do these apparently queer contrasts exist? It is simply a question of humus. We know what humus is or what it comes from, and we know that fully half of the available plant feed in any soil is found in the humus. Take a soil rich in humus and when the latter is separated from it a very small fraction of the bulk of the soil has been taken. The humus from a bushel of rich soil will contain perhaps not enough to fill an egg shell. Its power lies in making the elements available and in it we have a valuable servant. This brings into an available form the dormant potash and phosphoric acid. We can make it mine our potash for us, distribute it and pay the freight for us.

This latter proposition is a partially theoretical one. We do not know how much of the potash it will find for us. It cannot create it for us as far as we know. That would be contrary to all present knowledge. If it can find enough for our use as we go along, we can dismiss the question of the future supply of potash. There still remains the question of our supply of nitrogen.

We know that four-fifths of our atmosphere is nitrogen, but it is hard to get hold of and hard to keep. We are all familar with the fact that legumes take nitrogen from the atmosphere and add it to the soil, thus giving us a sure and large supply of this element. Nature lends us a helping hand here again and it remained for science to show us how to take it from the atmosphere in a definite chemical form. This has recently been done in a manner which makes it a commercial proposition.

All of these facts point to the possibility of our some time supplying ourselves with the expensive elements needed in agriculture, by reaching into Nature's storehouse that surrounds us continually, and helping ourselves. Nature has so arranged it, however, that we cannot take them to the exclusion of our neighbors.

NEW ORANGE BOX.

H. P. D. Kingsburg and William Hinckle were here from Redlands last week, says the Riverside Enterprise in the interest of the new orange box to be manufactured at Redlands and other points in Southern California. The box was investigated by packers and all who saw it were enthusiastic over its possibilities.

The new box is manufactured at a mill in Wisconsin owned by the Pacific Packers' Supply Company, the name of the corporation that will make the new box. It is a standard size box, the distinguishing feature of which is its material. It is manufactured of material called rawhide wood pulp which is peculiarly tough and resilient.

The four sides of the box are composed of one piece of this pulp board held in place by reinforced cleats secured by galvanized iron clamps. Many points of advantage are claimed over the old wooden orange box among them being that there is enough "give" in the material to prevent the fruit crushing, and the fact that there are no sharp edges to cut the fruit.

Both sides can be ventilated by holes perforating the pulp board of the box and be made nearly air tight. The box is practically indestructible and can be used for other purposes after it has done service for oranges. When packed either on the sides or ends in a car there is perfect ventilation, and the loss of fruit from decay would be considerably lessened.

The box weights two pounds less than the wooden orange box, and seven boxes more to the car could be loaded. This would be a saving in freight on the California orange crop of 25,000 carloads, or $166,000.

THE IRRIGATION CONGRESS

THE National Irrigation Congress will hold its next annual convention in Sacramento in September next, and arrangements are already under way for making it the greatest convention of that body ever held, as it will be the most inmportant. Irrigation in the Sacramento valley has taken wonderful strides in the past few years, and upon it depends largely the future prosperity of that valley. The great wheat ranches of the early days have been worked to death by successive cropping, until today wheat growing can only be carried on at a loss. Wheat is the one crop which could be grown without irrigation, and with its decline these great ranches must be cut up and put under irrigating water or lie idle and be a constant loss to their owners. These are facts which have been brought sharply home to that section and stronger efforts are being made to get water on these lands and offer inducements for settlement. In view of this fact it will be seen that Sacramento has a special interest in the coming convention, and that no effort will be left untried to add to its success. All California is also interested and, perhaps, to a greater extent the whole arid west, as California is the exemplar along these lines and other sections come to us to learn our methods, and when their delegates meet in our capitol city, they will have many object lessons before them and will be within easy reach of the great irrigated area of Southern California, in which irrigation has reached its perfection.

RICE FARMING.

Experiments have been made several times in the past in the line of rice growing in the San Joaquin valley and along the San Joaquin river. None of these have been successful for some reason, either lack of knowledge on the part of the experimenters or unsuitable conditions, but there is no doubt that soil, climate, moisture and conditions along the San Joaquin river are as suitable for this cereal as the higher lands of the same region are for other cereals. K. Ohashi, who has extensive rice plantations in Louisiana, has taken up the work here, and will start an experimental farm of 160 acres. If this is successful then thousands of acres will be put out to this useful grain.

DRY FARMING.

Colorado, Utah and other states in the arid region are giving much attention to what they call "dry farming," and a convention was recently held at Denver to discuss its advantages. Dry farming has been in vogue in California for many years, and consists of deep plowing in the fall and leaving the land in such condition that all the winter rainfalls will be absorbed by the ground, instead of running off, followed by thorough cultivation in the spring and the keeping of the surface thoroughly pulverized. By this means the surface soil acts as a mulch and prevents the escape of the soil moisture, which is so conserved for the crops which may be planted. This has been pracically the plan followed in many sections of California with great success, and is not new with us, although it is only in the past few years that it has been discovered in Colorado. It is the plan applied to all our orchards, and many of our vegetable crops are produced in the summer with no other moisture than that which falls during the winter months.

HORTICULTURAL INSPECTORS.

The bill introduced into the Assembly by P. F. Cogswell, of Los Angeles, increasing the per diem of Horticultural Inspectors from $2.50 to $3.00 per day, has passed both houses and is now in the hands of the governor, by whom it will probably be signed, as it is a fair bill, and gives a very important body of our horticultural guardians a slight advance over the pittance they have received in the past.

WAGES FOR JAPS.

As a rule the gruit growers prefer white labor in the orchards as they get more work done and in a better manner, and can afford to pay good wages. When they are compelled to hire Japs during the scarcity of labor or in the rush of the season they find that the little brown men are constantly demanding more wages and endeavoring to get the same by playing one grower against the other or misrepresenting what each grower is paying.

This season the growers have decided to stand together upon the Jap question and have signed an agreement not to pay over 12½c per hour and the Japs board themselves. Should it be necessary to make other arrangements a meeting of the growers will be called to attend to such matter. This has nothing to do with the wage rate for white labor. Those who signed the agreement are: J. B. Wilkie, B. F. Walton, H. H. Wolfskill, L. H. Woodworth, Dr. Jackson, R. C. Kells, F. Hauss, R. N. Kells, N. Robinson & Son, E. T. Barrett, Edwin Winship, M. S. Peters, Peri Montna, Robt. Keck, A. Bauer, J. A. Littlejohn, J. N. Brandstatt, A. G. Bremer, George Walton, Jr., A. F. Bradford, J. A. Ashley, E. Graham, Thomas E. Holmes, R. T. Hoon, Lloyd Wilbur, E. B. Starr, W. R. Carpenter, E. S. Moors, J. L. Duncan, Grant Bros., C. G. Best, H. G. Littlejohn.—Sutter County Farmer.

DEFINITION OF A BOOSTER.

The following has been handed the Review by "one of them:"

"A booster is one that is for his town, when right; and when wrong, helps to right it.

"He asks for no special privileges to the detriment of the whole citizenship.

"He asks for a square deal for the whole city, and, when he cannot get it, kicks like a bay steer.

"He has a good word for every man, and every just and honorable enterprise.

"He lauds the citizens of his town, and its great advantages, and can see more good than bad.

"He kicks against city extravagances, but pleads for just expenditures.

"He glories in everything that will spread the fame of his city, and is ever ready to extend the glad hand to all newcomers.

"In fact, a real, genuine 'booster' is a man who loves justice, loves his city, loves her institutions, and is ever ready to put her interests before selfish schemes of all kinds."—Redlands Facts.

Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

A Plan for the Improvement of Cattle

By E. S. SHAW, of the Live Stock Experiment Station, Michigan

THE chief fault of the common cattle found today is their lack of quality and uniformity; this is not due so much to the lack of infusion of good blood as to the indiscriminate admixture of blood of breeds of both beef and dairy types. It is not necessary for us to attempt to present and establish proof of this assertion, as every live-stock producer can secure abundant evidence for himself in a short time, by simply exercising the faculty of observation. In traveling about by wagon-road or rail, note the number of animals in each herd seen, also the variation in type, form, and more particularly, color. Except for the herds of the few growers of pure-bred, or high-grade cattle, the common bunches will be found to include a great variety of color and types. In some herds red, white, black, brindle, and all conceivable combinations of these colors are to be found; at the same time some individuals will conform in a measure to strictly beef form, others quite markedly to dairy form, with all gradations, between these two. The indications of blood, as seen in color, will undoubtedly attract the attention of the casual observer more readily than other features. In other words, the presence and admixture of so many colors in common herds indicates that Shorthorn, Holstein, Jersey, and, less frequently, Hereford and Ayrshire blood has been freely admixed. The seriousness of this lack of uniformity in breeding, quality, color, form, etc., is not fully appreciated. For the past ten or twelve years, with one or two exceptions, the Chicago market has been topped by a certain breed of cattle sold in car-load lots. The reasons for this are found in the word uniformity. They have been uniform in size, color, form, finish and quality; in fact, as much alike as so many peas; you see one and you see them all. This prime requisite of uniformity can never be secured through mixed breeding.

Causes of Lack of Breeding.

The indiscriminate admixture of the blood of the various breeds has been one of the most direct causes of the production of inferior stocks. This has not been restricted to the breeds within the beef and dairy classes, but includes admixture of the blood of the two classes. With the rise in prices of dairy products, the common cows have been bred to dairy bulls; with depreciated values for dairy products, these same cows and their female progeny have been bred back to beef sires, and so on. On the other hand, there are plenty of instances where herds possessed of cows of a small type, producing a small flow of rich milk, have been bred to a bull of a larger breed noted for heavy milk flow, and vice versa. There are too many animals in our yards today saved from bulls bred to females for no other purpose than to "freshen them again."

Another potent force tending toward the production of inferior cattle is found in the too prevalent use of grade and scrub bulls.

Improvement not Difficult.

Questions of breeding are generally regarded as being obscure, intricate and extremely difficult, except to those skilled in the art through long years of training. It is true that we are obliged to look back upon the achievements of the "master breeders" of history with feelings akin to reverence, for their tasks of type-founding were difficult, requiring a whole lifetime in some instances to gain the mastery, and in others two whole generations to attain the highest success. But the initial step in live-stock breeding for improvement confronting us today, is an exceedingly simple one; we do not need to undertake the establishment of new types or breeds, as there are plenty now in existence to choose from, whi h, judiciously

A Jersey cow of superior excellence is shown in the above cut. She is the property of L. Bradbury, Duarte.

chosen, will respond favorably to the conditions to which they are adapted. The first step in the line of live-stock improvement must come from the cessation of the practice of admixing the blood of the various breeds, and of using grade and scrub sires.

Plan for Live-Stock Improvement.

Before introducing the plan of live-stock improvement, known as up-grading, we wish to state that it should be the ambition of every man owning live stock to eventually get into some line of pure-bred live-stock breeding. The plan we have to suggest and discuss for the improvement of the common stocks of the country, is that known as up-grading, which consists in ingrafting the characteristics of a superior breed upon animals of common or mixed breeding for the purpose of improving them. This improvement is due to the superior quality of the males used, and chiefly their prepotency, or power, of transmitting accurately these qualities to their offspring. This plan differs from cross-breeding, in that pure blood is used on the sire's side, and females of mixed blood, or no blood, on the dam's side. Thus we have the prepotency concentrated in the bull and the very opposite in the females; as the more mixed the breeding, the less stable are the inherent characteristics of the individual, and therefore the less resistant to improvement. It would be absolutely impractical to advise all owners of common cattle to send their stocks to the block and purchase pure-bred foundation stocks; only a few could do this for the following reasons: First, if the great majority now possessed of common stocks were to simultaneosuly seek to purchase pure-bred foundation stocks, they could not get them; they are not in existence, for only about one per cent of the cattle in the United States are possessed of pedigrees. Second, the finances of a great many holders of common stock are not such as to allow them to make extensive purchases of pedigreed animals, and replacement is out of the question, as it would require the returns from the sale of three or four common animals to purchase one pedigreed one. Third, it is highly desirable for breeders to grow into any line of pure breeding rath r than to buy into it suddenly, and take up a work in which experience is necessary.

Use of the Animals at Hand.

In general, then, it is necessary for the majority of holders of common stock to make the best use of the animals on hand, with a view to improving them. Let us suppose the case of a herd of common or mixed cattle of, say, eighteen head, and apply a plan of improvement. The first thing for the owner of this herd to do, is to decide upon some one line of production, either beef or dairy, and then stand by the resolution. Without this he cannot improve his herd, for the animals of mixed breeding are largely the result of frequent change of purpose. Suppose in this case, that the owner has decided to go into the dairy business; that being the case, the next thing to do will be to look over the herd of eighteen and decide which ones are so possessed of dairy type and characteristics, as to warrant their being used in the business. They can be divided into three classes, such as best, medium and inferior, from a dairy standpoint. Then, in the majority of cases, it will be found to be a decided advantage to send the six inferior ones to the block and use the remaining twelve for the foundation herd. Having selected the females to be retained, the next and one of the most important steps is to decide upon the breed to be used in improvement. In this, adaptability of the breed to the conditions, and the question of personal preference, are the two important factors; the decision of this question is also an important factor, for a change of mind after the work has begun, and the use of other blood, is more apt to result in retrogression for a time, than improvement. Having decided upon the breed to be used for improvement, suppose it is the Holstein, then purchase the best Holstein bull that the pocketbook will allow. Mate this bull with the twelve selected cows, and use him two seasons, after which his progency will be old enough to breed. At this point secure another Holstein bull, a better one than the first if possible; follow him with others of the same breed, indefinitely. Let it be Holstein bull after Holstein bull, nothing but Holstein bulls. We have cited the Holstein merely for the purpose of this illustration. The same plan must be used, no matter what the breed is.

The Grade Sire.

Attention has been directed to the fact that high-grade animals may be eventually produced capable of equaling those of the pure-breed used in their improvement, insofar as meat or milk production are concerned, but at the same time they can never equal them in prepotency nor become possessed of pedigrees, except in rare instances. So far as external form and indications of quality are concerned, a high-grade sire may look equally as good as a pure-bred one, and still this is no justification for his use. Though an animal may be an exceptionally

good individual, if he is lacking in prepotency, as the grade derived from mixed blood on the dam's side is sure to be, his offspring cannot equal those of the pure male. And so in actual practice, except in rare instances, grade sires fail to produce offspring possessed of the marked uniformity and quality of those from the pure-bred male. We call attention just here to the fact that the quality of prepotency more markedly manifest in the breeds of most ancient origin has been developed through centuries; we must not expect to develop it in high grades in one decade. It would be useless to say that no grade sires should be used at all, for if 27,800 bulls are needed in Michigan, as indicated by the last state census, only a portion of this number could possibly be made up of pure-breds, as they are not to be had. Therefore, the only rational thing to advocate is the utilization of all pure-bred bulls to their fullest extent, the use of the fewest possible high-grade sires for the present, the use of the best of this class and the replacement of these by pedigreed animals as rapidly as possible. Occasionally, in purchasing, a man hesitates between two sires, the one a grade, the other a pure-bred; the former perhaps about as good as the latter in individuality, judging from appearances. On this basis, the purchaser secures the grade because it is at least one-half cheaper, but in considering the final results we should not lose sight of the fact that the superiority of a crop of ten calves from a pure-bred sire is almost sure to be so much greater than the same number from a high-grade, that the difference in the purchase price of the two sires may be more than made up in a single season.

Evil Effects of Breeding Immature Females.

During the past decade or two there has been a growing tendency to breed heifers at an early age; this is particularly true among the dairy breeds. The men who advocate and practice the breeding of heifers so as to produce calves under or at about 20 months of age, are extremely numerous. In fact, the practice has been carried to such an extreme that in many localities mature cows of some of the dairy breeds cannot be found bearing the same size that these types did twenty years ago. This practice is supported chiefly on the following grounds, viz.: First, that the earlier a heifer is made to produce, the sooner she begins to make some financial return for her keep, and second, the capabilities of the dairy cow can be increased if stimulated at an early age. There are those who claim not to object to lack of size in dairy cows, and also that the smaller cows are more profitable, but this latter claim has not yet been proven. The relative value of small versus large dairy cows as economic producers has not been determined, though much discussed. It is a notable fact, however, that the world's record-makers and the majority of the cows entered in the various advanced registry associations, are, in general, considerably above the average as to size. It is also a notable fact that the twenty-five Jersey cows entered in the dairy-cow demonstration at St. Louis in 1904 were large cows, the average weight for the twenty-five at the beginning of the test was 911.2 pounds, and at the close 983 pounds. These figures place them considerably above the average of the cows of this breed in general use in many dairy sections today These cows were used in a test where comparative economic production was one of the main features. Some expert dairy-breeders are inclined more and more to the belief that heifers should be allowed greater maturity before dropping the first calves, and are also permitting them to lay on more flesh than has been thought to be safe; these men are demonstrating the accuracy of their theories in the results produced. While it is clearly apparent that immature breeding has reduced the size of many of our dairy-cattle, it has not been proven that diminished constitutional vigor has accompanied this loss of size, though many hold to that view. It is rational to assume that in unduly immature breeding some of the physiological laws of nature must be violated, and this cannot occur without being followed by some evil results. No fixed age can be given for the breeding of heifers, it should be dependent on the rapidity and character of the development of the individual.

Desirability of Co-operation of Breeders.

It would seem highly desirable that some form of co-operation, in breeding methods, should be established by communities, such, for instance, as the joint ownership and use of males by several parties rather than one. In theory this proposition sounds well, but in actual practice it has not worked satisfactorily in the majority of instances, as illustrated by the universally undesirable results from the formation of stock companies in the ownership of stallions. In this instance, however, it is only fair to venture the assertion that the initial troubles among these companies is generally the fault of the organizer or promoter, the seller of males, who unloads something on the company that does not prove satisfactory. One cannot conceive of any logical reasons why several men in a community could not form a co-partnership in the ownership and use of good sires. If such a plan could be followed, the good influences of superior sires would become more far-reaching and fewer males in all would be needed than in the case of individual ownership.

Probably it would not be wise to advocate a single breed of cattle, for instance, for each community, but it would unquestionably be wise to limit the breeds to those only which are peculiarly adapted to the conditions of each community and the lines of production therein pursued.

There is no disputing the fact that individual likes and dislikes vary greatly, but it nevertheless seems to be the case, that if one man introduces a certain breed, his nearest neighbor will at once introduce another, apparently for no other purpose than to have something different; whereas, if they were both using the same blood it would work to their mutual advantage.

"I made good men out of my boys by saying: 'Come on, boys,' rather than saying: 'Go to work, boys.'" A good deal is in the start toward making men out of boys. A good start is half done.—Register.

Accustom the colt to being handled by having a halter on and occasionally taking hold of it when feeding the mare.

R. S. Shaw of Iowa, in writing on cattle breeding, says the first step in the line of improvement must come from the cessation of the practice of admixing the blood of the various breeds and of using grade or scrub sires. The next step is to accept the experience and achievements of specialists in developing the different types of cattle.

Never wean the foal too quickly but by degrees. It is best for both the mare and foal to take two or three weeks to do it. Feed foal often, both during the time of and after weaning.

Always be careful to give the mares plenty of exercise in the late fall and winter after the work on the farm is done.

THE MILKING MACHINE.

THE milking machine has been the subject of investigation by the Department of Agriculture, and a report has been made by C. B. Lane, assistant chief of the dairy division, to Secretary Wilson.

Recent improvements in milking machines, Mr. Lane says, have led to their introduction and practical use in some of the larger dairies of the country, and there are indications that these machines may come into general use in the near future and become an important economic factor in the dairy industry.

With the type of machine used in the investigation the milk is drawn by intermittent suction which is created by either a vacuum pump or a steam ejector. The machine consists of a heavy tin pail with a tight-fitting cover in which the motor is located. There are teat cups which fit over the teats of the cow, and the milk is conveyed to the pail through rubber tubing. Steam engines, gasoline engines or electric motors are used for power.

A machine milks two cows at a time. The experiments showed that much time was saved by the use of the machines over that required by hand milking, and that the yield of milk was fully as great, though the percentage of fat was somewhat less in the machine-drawn milk.

Some bacteriological experiments were made to test the sanitary character of the machine-drawn milk. As might have been expected, the machine-drawn milk was found to contain decidedly smaller numbers of bacteria when the machines were kept in clean condition. It was found, however, that the machines were somewhat difficult to clean and that care was required. If properly cleaned and sterilized, the machines may be very effective in the production of sanitary milk.

Registered Holstein Dairy Cow

Mother of a World's Record Breaker. Minnewawa Stock Farm.

HOLSTEIN-FRIESIAN CATTLE.

The cattle known in America as Holstein-Friesians belong to the Shorthorn, lowland race, native to the low-lying, fertile lands of Europe bordering on the North Sea; of which race, from the dairy standpoint, the Holstein-Friesian family is the most highly developed. These cattle might have been better named Friesian, since Friesland, and the neighboring provinces of Holland, is the central home from which this breed of cattle has been so widely disseminated over the old world, and from which some 10,000 head of foundation stock has been brought to America. The Friesian people are among the most conservative of the Germanic race, still holding to, and speaking among themselves the old Friesian language, although also able to speak Dutch, the official language of Holland. They have been equally conservative in holding to their ancient industry of cattle rearing, an occupation for which their low-lying lands are especially fitted; and, as the Roman historian Tacitus speaks of them nearly 1900 years ago as cattle breeders, paying a tribute in cattle and hides to the Roman empire, so we find them today making dairy husbandry their main industry. Holding mainly to one occupation down through the centuries, and passing the business from father to son, it would be strange indeed if their breed of cattle did not reach a very high degree of development; so it is in no way surprising that we should find these Friesian dairymen possessed of a breed of cattle which, as an all-around dairy breed, is superior to any other breed known.

A Dairy Breed.

While in character the Holstein-Friesians are essentially a dairy breed and are so regarded in America, yet as an all-around dairy breed the matter of beef and veal must not be lost sight of, and in Holland these are very important points. There few cattle are allowed to pass their seventh year; but before they pass out of their prime they are fattened and sold as beef. The late Prof. I. P. Roberts in speaking of Holstein-Friesian beef said: "I ate it for three weeks, and the English beef for two; and while not so fat as the Shorthorn, it was to my taste superior." The breed reaches full growth and maturity at about five years of age, reaching full height at between two and one-half and three years of age, and each year for the two following years adding about one and three-fourth inches in length, three-fourths of an inch in width of hips, and two inches in girth of chest. Mr. S. Hoxie, former superintendent of H.-F. Advanced Registry, states that the average measurements of cows upward of five years of age received to entry in the fourth volume of the Advance Registry were as follows: "Height at shoulders, 51.8 inches; height at hips, 53 inches; length of body, 64.9 inches; length of rump, 21.4 inches; width of hips, 21.9 inches; width at thurl, 19.6 inches; girth of smallest circumference of chest, 75.6 inches." He states that the average weight of these cows was 1262 lbs., and that the average measurements are those of what might be deemed a typical animal of what is technically known as the milk-and-flesh form of the breed, the form that is most popular in America.

Claims for Superiority.

Owners and breeders of Holstein-Friesian cattle base their claims for the superiority of this breed over all other dairy breeds mainly on the following points: First, that the Holstein-Friesian is a large, strong, vigorous cow, full of energy and abounding in vitality; second, that her physical organization and digestive capacity is such that she is able to turn to the best advantage the roughage of the farm, converting the same into merchantable products; third, that she yields large quantities of most excellent milk, fit for any and all uses and especially fitted for shipping purposes; fourth, that heredity is so firmy established through her long lineage that she is able to perpetuate herself through the production of strong, healthy calves; and fifth, that when for any reason her usefulness in the dairy is at an end, she fattens readily and makes excellent beef.

While men usually engage in the dairy industry for the profits directly and indirectly to be obtained, and not for the health's sake or for the pleasure therein, yet the aesthetic side of any business should not be lost sight of; for in the breeding of Holstein-Friesians all of these objects may be attained, the owner deriving such pleasure and satisfaction from the ownership of fine animals as can in no way be measured in money.

Western Farmers' Needs.

The time is fast approaching when even the Western farmer cannot afford to keep a cow mainly for the calf which she produces, as in such case the handicap against beef production is too great. When a calf takes practically all the milk its dam yields, it starts out in life with a mortgage upon it to the value of the cost of keep of its dam for one year; and this debt, as well as the cost of raising, must be repaid out of the selling price before there can be any true profit in the beef. If the owner of such cows plan to milk them, run the milk through a separator, sell the butter-fat to a creamery and feed the skim milk to the calves, he introduces the labor factor and finds himself a full-fledged farmer-dairyman, with all the labor incident to dairying, and cows that will hardly yield enough to pay for the extra work: Over and above all labor and the cost of keep, the average Holstein-Friesian cow will show a nice profit on the butter-fat she producers; while the skim milk will not only rear her own calf, but a couple of litters of pigs besides.

An ideal beef form has been created in the mind of the public, and a false prejudice engendered against

anything that does not agree in form with that ideal. At present this unjust prejudice militates against the dairy-bred steer on the hoof, even though he be as well reared as the beef steer; although when it comes to the final show down at the block, the difference between the two is not great. Rear a Holstein-Fresian steer as a Short-horn is reared, and he will indeed be an expert judge who can distinguish the beef when it is placed before him at the table; while repeated tests at the block have proved that the per centage of choice cuts is nearly as large in the one case as in the other. As an all-around breed, and the one approaching the nearest to the long-desired dual purpose animal, the Holstein-Freisian is unsurpassed.—Malcolm H. Gardner.

INCOME FROM AYRSHIRE COWS.

The value of a dairy breed is the net profit received above the cost of food and care given, and in order to obtain results of actual business I sent requests to the leading breeders of Ayrshires to give me the yearly returns from their Ayrshire cows, with cost of keeping. Some of the returns are of no especial value as the herds are not all Ayrshires, but I have given below the result of such as are indicative of the breed, and have withheld owner's name, giving a number instead.

C. M. WINSLOW, Secy.

PUMPKINS AR E GREAT CROP FOR HOGS.

A writer in a farm exchange, who appreciates a good things, says:

About the nearest to a genuine snap I have struck for a long time is the pumpkin crop I got in the sweet corn this year. In two acres of late sweet corn I mixed some sweet pumpkin seed with the corn in the planter boxes, using about three pounds in all.

We have just finished hauling them in, and we got twenty-one big wagonloads of pumpkins off the two acres, and it does not seem to have hurt the yield of corn in the least. All they have cost us is the cost of the seed, about 75c. There is about a carload of good pig feed in them and several hundred pounds of seed, which we will save and sell. This may sound like a pretty big pumpkin story, but if you don't believe it I will show you a photo of the pumpkins next month.

The large cheese or so-called sweet pumpkin seems to be the best for this sort of planting. With live pork worth 6 cents per pound, I don't see why more farmers don't grow pumpkins this way.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

SHARPLES' BUSINESS DAIRYING FREE

Contains all the money-making points of dairying. Among the subjects treated you will find How to Feed, What to Feed, When to Feed, What Foods Produce Most Milk, How to Take Care of Milk-Producing Foods, How to Feed Silage, the Care of the Milch Cow, and many other profitable and practical suggestions that help swell the profits of the dairyman. With the book we will send additional information telling you how and why you can get the most out of you milk by using the

Sharples Tubular Cream Separator

We guarantee that with a **Tubular** you can get 50 per cent **more** cream over the old pan method of skimming, and 6 per cent over any other cream separator made. Sharples Separators get **all** the cream and the **Tubular** is the easiest running, easiest cared for, and easiest kept clean. There is just one tiny piece in the bowl, the milk can is low and handy, the bearings are self oiling. Write for the "Business Dairying" at once stating number of cows you keep. Ask for booklet D.260

Mr. S. L. Boyer, Venetia, Pa., says "The Tubular makes me $255.00 yearly."

The Sharples Separator Co.,
Toronto, Can. WEST CHESTER, PA. Chicago, Ill.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

POMONA MANUFACTURING COMPANY

Corner of Bertie and Gibbs Streets POMONA, CAL

Dairy Development at Corcoran

New Town in Kings County Surprises the State With Its Remarkable Advancement Along Stock and Dairy Lines

THE readers of the Cultivator have heretofore been apprised of the extraordinary value of farm lands around Corcoran when viewed from the standpoint of the dairy interests.

It is to be doubted if there is another section of the state better adapted to stock raising, or more essentially to dairy work than this, because of the nature of the soil, the climate and the abundant supply of water for irrigation. A country that can produce six crops of alfalfa a year, which averages from one to one and a half tons to the acre, has not a superior, certainly, on the Pacific Coast. The possibilities of the dairying interests are only measured by the number of dairies which can find a location in this favored section. A year ago one of the pioneer creamery men of the Pacific Coast, Mr. George A. Smith, of Los Angeles, known throughout the Coast states as a successful creamery operator, purchased a holding of several hundred acres of land, and began the collection of a herd of dairy cows. Today he has as fine a herd of cows as any dairyman would wish to own, and he is adding to that herd the best strain of milk cows wherever he finds them to his liking, Jerseys being his favorite breed.

Two years ago the ground at Corcoran on which the above farm buildings are situated was grazing land for sheep. Today more than one hundred well-appointed farms cover this and adjacent territory.

Creamery.

Within the year Mr. Smith has built and equipped one of the most substantial and up-to-date creamery plants in the state. It is fireproof, with double air spaces in both walls, and cement floors, a six-ton capacity ice machine, and machinery complete for pasteurizing cream for butter making and also for shipping to Los Angeles for the sweet-cream trade in that city.

Speaking of pasteurizing and its value in improving the quality of butter, creamerymen say: "If they could get the cream delivered perfectly sweet and free from bad flavors, they would not bother with a pasteurizer, although it would improve the keeping quality of the butter, but the hand-separator creameries will find cream every day that can be improved by pasteurizing and keep it from spoiling the whole lot. Besides, pasteurization is absolutely necessary in order to at all times deliver the cream sweet and in good condition for the sweet cream trade in the city. After this sweet cream is pasteurized it is refrigerated and shipped to Los Angeles in sterilized cans. Mr. Smith pays his patrons an additional price of about 10 per cent. for the sweet cream.

"Pasteurizing takes out most of the bad flavors in the cream that come from the feed or from the action of bacteria. The germs that cause the bad flavor in the cream can nearly all be killed, and their growth can be checked, so that when you add a good starter to your cream directly after pasteurizing and leave it stand at 70 degrees for a few hours it will develop a fine delicate flavor, so that you can cool it down to churning temperature and get it made into butter before the undesirable germs will renew their growth; and as butter is not a suitable germ food, it can then stand a long time at a medium low temperature before it will go off in flavor; whereas the butter made from raw cream with its undesirable germs in full growth will go off in flavor much faster." This accounts for the extra fine quality of the Corcoran creamery butter.

Mr. Smith believes in the value of pasteurization, and as an argument in its favor, states that his butter brings the highest price in the Los Angeles market, and that the demand far exceeds the supply. This butter is pasteurized, refrigerated and shipped to Los Angeles. The capacity of the Corcoran Creamery is 3000 cows. Five hundred cows are supplying the creamery at the present time, but it is expected before the season closes that one dairyman will put in 2000 cows, from which he expects to derive a net profit annually of $50,000. He has alfalfa growing for feed now on the greater part of 3840 acres.

Improved Stock.

Within the past season a marked improvement has been made in the character of the dairy cows in and about Corcoran. Good judges of dairy cattle say more thoroughbred Durhams, Holsteins and Jerseys have been shipped to the farms around Corcoran, than to any other dairy locality of similar size in California. Not only is there an improvement in dairy stock, but beef cattle as well. It has been learned that large profits are realized from ranging beef cattle in the hills, and when grown, in finishing them off with alfalfa and a little Kaffir corn, in which the valley abounds.

High Prices.

It is a fact worth mentioning at this time, that prices are higher for all dairy products this year than at any previous period in the history of the state. By this we mean prices for butter fat. For the month of January some of the dairies in the territory of which we speak paid $8.75 per head, not estimating calves, pigs or skim milk. It can readily be seen what the income would be on a dairy of fifty cows or more, when it is considered that alfalfa and feed in general is produced so cheap. It is difficult to find an occupation in California that pays better returns than dairying in Kings and Tulare counties; and when this fact is generally known, the lands which are now selling for from $30 to $40 an acre at Corcoran, will readily bring $100 per acre. During the past month the Security Land and Loan Company disposed of about 2000 acres of its Corcoran lands, which are of the richest class, and so productve as to cause Easterners to absolutely doubt the returns received from them until they have made a thorough investigation of the facts.

The soil is a deep, rich alluvium, making it the most valuable land in the state for alfalfa, grain, asparagus and sugar beets. Some of it is also well adapted to raisins.

When you consider that as high as six crops of alfalfa can be grown in a season, and that Kaffir corn needs but one irrigation to cause it to produce 80 sacks to the acre, the remarkable fertility of the soil will be appreciated. What is true of corn is also true of wheat, oats, vegetables and sugar beets; wheat often yelding 70 to 80 bushels per acre, and sugar beets here have held the record of the United States in yield, percentage of sugar and degree of purity. Asparagus culture at Corcoran is proving some of these lands especially adapted to that industry. Experts say that the asparagus lands of Corcoran are far superior to most of the asparagus lands of the state, and the equal of the islands in the Sacramento river. No doubt these lands of a peat nature would be especially adapted to the growth of celery. There is also a large acreage of raisins being set out. Chaddock & Son, leading raisin packers of Fresno, are promoting the industry, and have purchased a site for a packing-house.

Climate.

The climate of this section is equable. During July and August, which are known as the hot months, the thermometer will range from sixty degrees at sunrise to ninety-eight or one hundred degrees at noon. In what are known as "hot years" the mercury will occasionally register one hundred and eight degrees, but this is exceptional; and it must be borne in mind that the heat is a dry heat, there being so little humidity in the atmosphere that it is not of the oppressive character that afflicts the people east of the Rocky Mountains. During December, January and February (which are termed the winter months) the mercury will sometimes fall to 24 degrees Fahrenheit (the lowest temperature on record is 20 degrees, only 12 degrees below freezing point), but during the greater part of these months the thermometer will range from 38 to 40 degrees between daylight and sunrise, the coldest part of the day, to 60 degrees at noon. The remaining seven months (March April, May, June, September, October and November), are as nearly perfect as could be asked for.

Corcoran is pre-eminently a desirable home for the agriculturist. Here the dairyman is in his element. The fields produce feed the year round for cattle, horses, hogs, sheep and poultry. Alfalfa is the chief forage plant, and produces four to six cuttings annually. The experienced farmer on irrigated land takes off a crop of barley and then irrigates the same and plants it to corn, and the average crop of corn is two tons to the acre and it sells readily at twenty dollars per ton.

The above illustration shows the growth of alfalfa in the Corcoran district, where from four to six crops are cut annually.

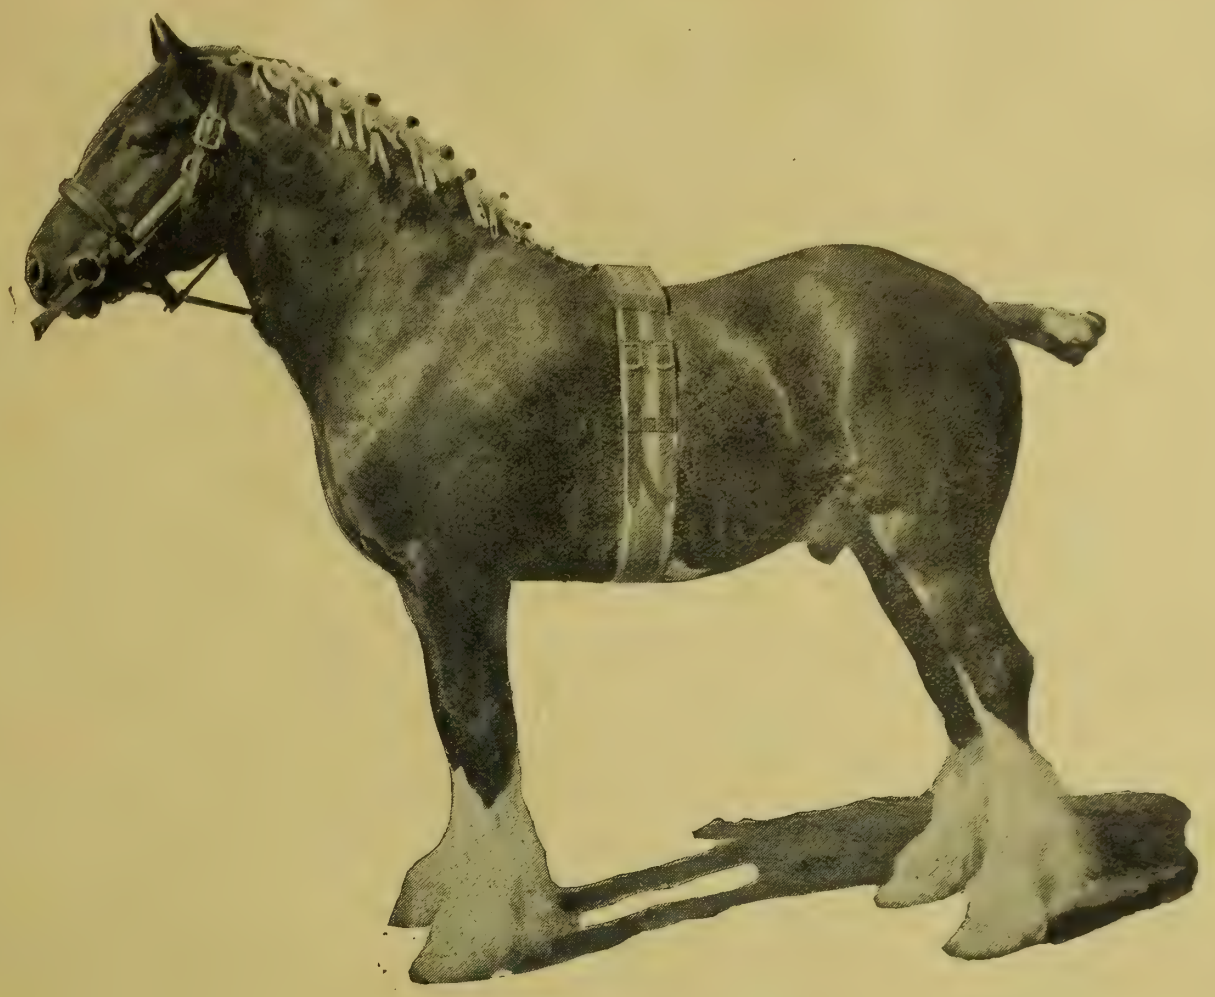
There is plenty of good land to be had at Corcoran at reasonable figures and the demand for labor is so continuous that the settler with limited capital will experience no difficulty in getting a fair start.

CLYDESDALE STALLION-MIRROR.

THE introduction of the Clydesdale as a draft horse has done much towards improving the standard of horses of this class in California. It is to be doubted if any other horse is better adapted to general purpose than the Clydesdale. It has been a question with horsemen which is the better breed for the farmer, the Percheron or the Clydesdale. Both have their strong points, and both are popular in their respective classes. In the Middle West the division is about equal; some farmers preferring the Clydesdale, and others the Percheron. In California the day is rapidly approaching, with the influx of Eastern agriculturists, when a higher standard of the draft horse will be demanded.

It has always been the case with new states that its cattle and horses improve with the growth and development of its agricultural interests. In Kansas the broncho and the cross-bred American horse have given way to the introduction of the finest types of draft and road horses. In Iowa, it is an uncommon thing to see a farmer driving a mongrel team. He is not satisfied unless his work horses are of the most improved breed, and his driving horse is something better than a common barnyard animal. The same is true of Illinois, which has become famous for its fine draft animals, as well as its high type of cattle and hogs. California farmers must get into the van of progress along the line of improved farm stock. We believe they are seeing the importance of this movement, and will reach out and improve their horses and cattle, as they appreciate the benefits to be derived from ownership of the thoroughbred stock.

The illustration presented herewith is from a life photograph of the Stallion Mirror, owned by Wm. McKie, 407 Aliso St., Los Angeles. This is probably one of the best types of the Clydesdale that has been introduced into California for some time. The horse has great muscular strength, is compactly built, and capable of wonderful endurance. Wherever this horse has been shown, as for instance at the Pasadena tournament, he has attracted very general attention.



Imported Clydesdale Stallion Mirror
First Prize Draft Stallion, Pasadena Horse Show, 1907

A WARNING FOR HORSE BREEDERS.

A wide-awake horse breeder gives a timely warning to those who are tempted by high prices to raise colts. He says:

The very rapid increase in the value of all good, useful horses will very materially stimulate the breeding business. Hundreds of people will start in an enterprise that promises such great returns, and the tendency will be to breed almost every animal that will reproduce itself, regardless of quality, soundness and a general desirability.

As a consequence, a great many horses of nondescript character will be raised at a loss alike to those who breed them and to the state, while on the other hand those who choose wisely and breed and raise only the best, using stallions and mares that are deeply bred in the best blood lines of the breeds that they intend to raise, and who by care and attention raise serviceable horses, useful for the purpose for which they are intended, sound, kind and beautiful, will not only make a great deal of money for themselves, but will greatly benefit the section of country in which they live.

There is practically no limit to the demand, at rich figures (which will grow larger each season for the next eight or ten years), for the horse that is bred right, raised right and trained to be good in his class, whether it is as a park horse, a reliable well-manned, sound, handsome family carriage horse, or a sturdy draft horse.

Breed them right, educate them properly, and the produce of a small band of well-bred mares with the right kind of stallion at their head will make their owner rich in the next ten years.

WHEN TO WEAN LAMBS.

No definite time can be named, for much depends upon conditions, kind and quantity of feed available, etc. In fact, letting nature take its course is about as good a rule as can be observed. If the ewe and young are on good feed, the lamb has, of course, learned to eat; and if the mother had to be given some grain to keep up her milk flow the lamb should have learned how to eat it, and so when deprived of its mother's milk entirely it will have learned to hustle for itself, and weaning will not be a noticeable event in its life.

While the milk flow remains good and the ewe is in fair condition there need be no hurry about weaning, leave it to be done by mutual consent of both parties interested. If separation is made while ewe is in fairly good flow of milk she better be confined to rather scanty pasture for a while, but the lamb should be turned into good feed. Rape or second growth clover is excellent for newly weaned lambs. A little bran, oats or even corn may be given with good results. At any rate, the treatment should be such that there be no setback to growth on account of weaning. If lambs suck into September no harm is done.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

U. S. CREAM SEPARATOR

IS AS GOOD AS REPRESENTED

The Cleanest Skimming Separator.

The chief reason you want a separator is to get more cream—more money— out of your milk. The U. S. gets the most.

Holds World's Record
For Cleanest Skimming

The Simplest Separator.

Both in operating mechanism and bowl construction. Three gears and the bowl are all the "machinery" there is to the U. S.

A "Simple Bowl" Separator.

Only two strong, simple, easily-handled, easy-to-clean parts inside. Gets ALL the cream.

The Most Durable Separator.

Few parts and those strong and finely built of the best materials by skilled workmen.

The Easy Running Separator.

Gearing correctly proportioned, strong but not heavy, accurately fitted, has ball bearings, and runs in oil.

The Safest Separator.

Gearing all enclosed within the solid, low, one-piece, iron frame.

Our handsome free catalogue not only tells, but SHOWS, everything about the construction and operation of the U. S. 27 pictures. Please ask for No. 20.

Laton, Cal., Dec. 20, 1906.

I purchased one of your No. 6 separators last January and have used it ever since. I find it as good as represented. It is still as good as new and does first-class work. It turns very easy. My 12 year old boy can run 12 gallons through without tiring. It skims clean and is very easy to wash. Have been out nothing for repairs.

NEED OF MINERAL FOOD FOR HOGS.

The longer we feed hogs, the more firmly are we convinced that a liberal supply of salts and minerals is one of the prime requisites for raising heathy hogs—especially here in the corn belt, where the food is naturally deficient along these lines. In his wild state the hog gathered his own salts and minerals and was as healthy as any other wild animal. In his domesticated state we must furnish him with these substances which his system craves, if we would have him enjoy his former health and vigor.

As soon as the little pigs are big enough to drink slop, they should have a little lime water mixed with it daily. Lime water has a tendency to prevent scours and at the same time aids in forming good strong bone. The writer never knew hogs that were fed lime water in their slop while they were pigs to break down. As the pigs grow older, they should be fed a liberal supply of charcoal every week. Charcoal is a great absorbent, and is very effective in ridding the pig's system of the impurities which are constantly gathering there.

It also strengthens the bone and helps to keep the intestines free from worms. To make charcoal, simply rake up the cobs in the hog lot into piles of two or three bushels each and burn them. When the cobs have burned until the pile is a glowing mass, put out the fire with salty water. Then see with what eagerness the hogs and pigs will devour every vestige of the remains. "Eternal vigilance is the price of success" in the swine business, as it is in every other walk of life.—Western Swine Breeder.

USING DISINFECTANTS FOR CHOLERA.

The tar disinfectants should be used daily about the feed troughs, floors, sleeping quarters, etc. No less than a 2 per cent. water solution of the disinfectant should be used, and every week; if the weather permits, the hogs should be dipped or sprayed with a 1 per cent. solution.

The hogs should not be fed on the ground or allowed to drink surface water. A sloppy diet of shorts, bran and corn or oatmeal is best for the sick and exposed animals. The water and slop must not be left in the troughs for the hogs to wallow in, and in order to lessen the opportunity for infection through the food powdered copper sulphate may be dissolved in the slop and drinking water in the proportion of one ounce of the copper sulphate to every ten gallons of water and slop.—[R. A. Craig, Indiana Experiment Station.

PUMPKINS AND COAL SLACK FOR HOGS.

The following from Wallace's Farmer contains information that is often called for by those who have not had much experience:

An Iowa correspondent writes that he has some fine pumpkins, and wants to know if they would be good to fatten hogs with; and if so, whether he should cook them or feed them raw. He has thought of cooking them and then adding oil meal, and wishes to know whether it would pay. He has also purchased a load of coal slack, and wishes to know if this would be healthful for his hogs.

Give them all the coal slack they want. There are no direct fattening qualities about it, but it doubtless takes the place of charcoal. For some reason or other hogs are exceedingly fond of it, and generally get what is good for them, even if they have to steal it.

As to pumpkins, we do not know of anything better for growing pigs. You could scarcely fatten hogs with them, because there is so much water in a pumpkin that the hog will not get enough of it to furnish the requisite amount of nutriment. The seeds form an excellent worm medicine, and the inside of pumpkins is an especially desirable feed where hogs are affected with worms. We would not go to the trouble of cooking them. Simply break them open and let the hogs have what they want. When cholera breaks out among hogs, about the only things permissible to feed them are pumpkins and blue grass.

WHAT DOES IT COST TO RAISE PIGS?

At the Canadian experimental farms alfalfa, clover and root pasture supplementing meal rations were compared with roots and meal fed in pens, and with meal in pens without supplementary feed, using five lots of five pigs each.

In the thirty-five days of the test the gain ranged from 1.31 pounds per head per day on root pasture to 1.77 pounds with the lot fed on roots inside.

The gain was most cheaply made with the last-mentioned lot, costing 3.09 cents per pound, and was most costly, 4.23 cents per pound, with the lot fed on meal without supplementary feed in pens.

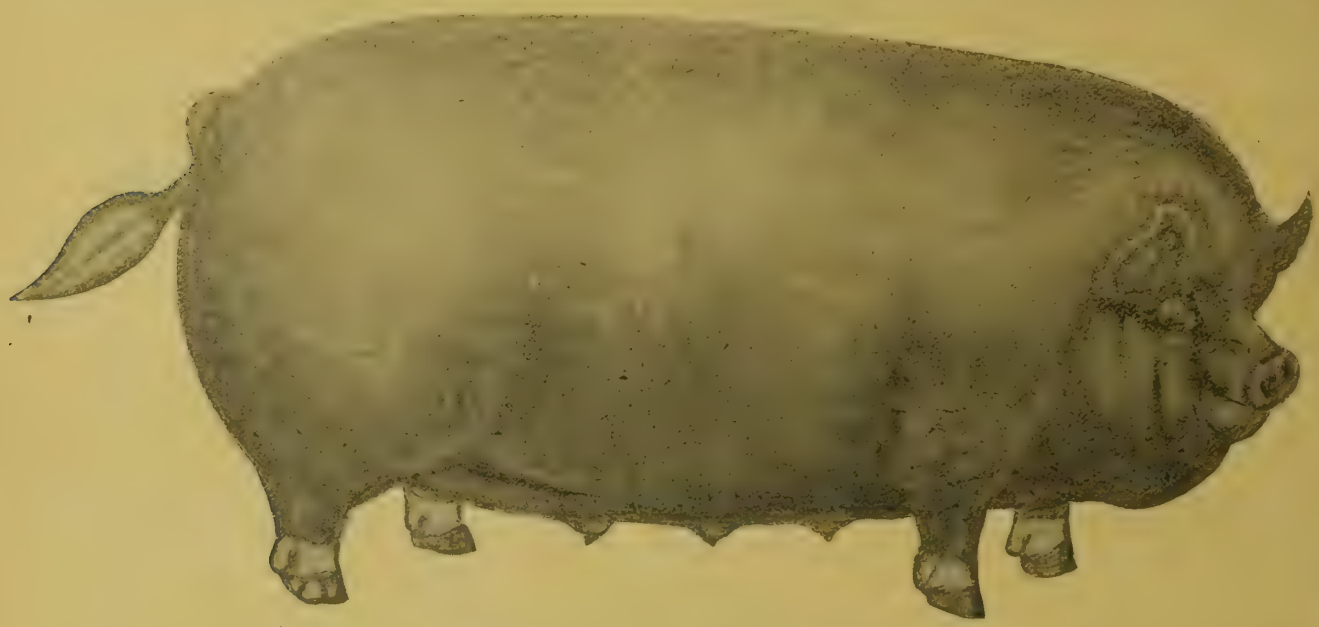
When pigs were pastured on an acre of ripe peas, the returns in pork were not satisfactory, but the effect of the exercise and the peas together was wonderfully beneficial so far as form of pigs was concerned, and so far as fitting them for finishing off for the packer when brought into the pens was concerned.

PROPER FEED MAKES HOGS HEALTHY.

Any hog, to have a clean system, must have the correct kind of feeding. Naturally, the hog eats much grass and forage. When he cannot get it he is unable to do what nature tells him to in keeping his system in exact tone.

Pigs grown on forage and carried into the breeding period and then through the winter on rightly cured hay and soft slops made of clean feed, are always ready to withstand exposure. A clean digestive apparatus and liver can throw off many impurities of a hog's body.

Alfalfa pasturage is found to make the best bone and muscle on pigs of any known forage.



The Medium of Quick Return.

With the advent of the Eastern farmer comes the standby of the farm—the hog. With alfalfa a cheap and wholesome feed; with the market around $7.00 a hundred for finished pork, where can a quicker or safer medium be found to return richer results than in the hog. Fifty of the above type of the "king of the farm" will lift any reasonable mortgage within a period of a few years.

GIVE THE BROOD SOW EXERCISE.

The sow, like all other breeding animals, should have plenty of room to exercise; also, a good dry and well-bedded place to sleep. A coop 6x6 feet is an ideal place and we have found shredded fodder makes just a little the best nest for them to sleep on.

We keep our coops in an open field; in fact, we have no inclosed hog lots, even our fattening hogs are never shut in lots or pens, but let run on pasture fields. This gives the needed exercise and aids in digestion, keeping them spry and active.

It is a pitiful sight to see a hog cripple off on three feet just because they have been inclosed in a close, foul pen. Then again, the hog is a splendid manure spreader, which requires no team or hand to assist.

"That man has a very shady business record." "Why, what has he been doing?" "He puts up awnings."

The man who pities himself always is pitiable.

A grafter by any other name would still be a thief.

Most makers of lamp-chimneys don't mark their wares—possibly they are ashamed to.

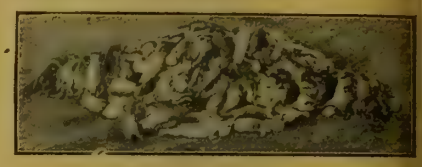
If I didn't make as good chimneys as I do, I wouldn't mark mine either.

I mark mine "MACBETH"—my own name—because I am proud to be known by them.

My Index—it's free—tells other reasons why my lamp-chimneys are marked and why I am proud to put my name on them. May I send it to you?

Address, MACBETH, Pittsburgh.

Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us.

We do not send less than 2 bottles.

GETTING INTO SHEEP BUSINESS.

The prices for breeding and fat sheep still continue high, even higher in many respects than last year. Many farmers who have been on the point of entering the sheep business in a small way have been scared by the prevailing high prices and the possibility that prices would drop and sheep become a drug on the market. While we realize that breeding sheep are high and hard to secure we believe that there will continue to be a strong demand for them for several years to come and at pices that are remunerative.

Last year the high prices paid brought to market many flocks of fat breeding ewes that should have been used in the production of more sheep. The result is that in the West as well as in the East the number of breeding ewes is far below the average, it will take several years, as estimated by conservative sheep men, to replenish the supply, because the range limits for sheep are being cut down by home-seekers in the West, and the increase must be made by the more extensive growing of sheep in the Central and Eastern states.

Considering all these features it looks as though one need not be backward about getting into sheep growing. It is, of course, not advisable to buy a large flock at once; secure a few and grow into the business. Then we cannot see that anyone need lose. Not every man can grow sheep successfully, but anyone who is willing to devote the proper amount of thought, time and energy to the matter is not going to experience a signal failure.

PASTURING GRAIN FIELDS WITH SHEEP.

The following is an account published of a Kansas man's grazing his sheep on his wheat:

A large flock of sheep was turned onto the wheat as soon as it furnished any grazing. They naturally grazed most on the side toward the buildings. They thus ate down some thirty acres quite closely. They were then removed.

At harvest time the yield from that close grazed was more than thirty bushels per acre. The yield from the other part of the field was but fifteen bushels per acre. The season was a wet one, and where the sheep did not graze the crop was rank and much of it lodged. On the part grazed the stems were far more numerous than on the other part, because of the abundant stooling of the grain.

When spring grain is prone to grow thus rank on rich prairie land, the crop will certainly be benefited by such grazing. Even in a dry season it may be thus helped on land spongy in character, that is, land that sinks much beneath the tread. Such land is common in certain areas of the prairie. Under the conditions named, the benefit comes in part from the treading and in part from the stooling of the grain. The treading helps to firm the land, and in this way its power to retain moisture is increased. There is also the incidental benefit from the droppings which fall upon the land while the sheep are grazing.

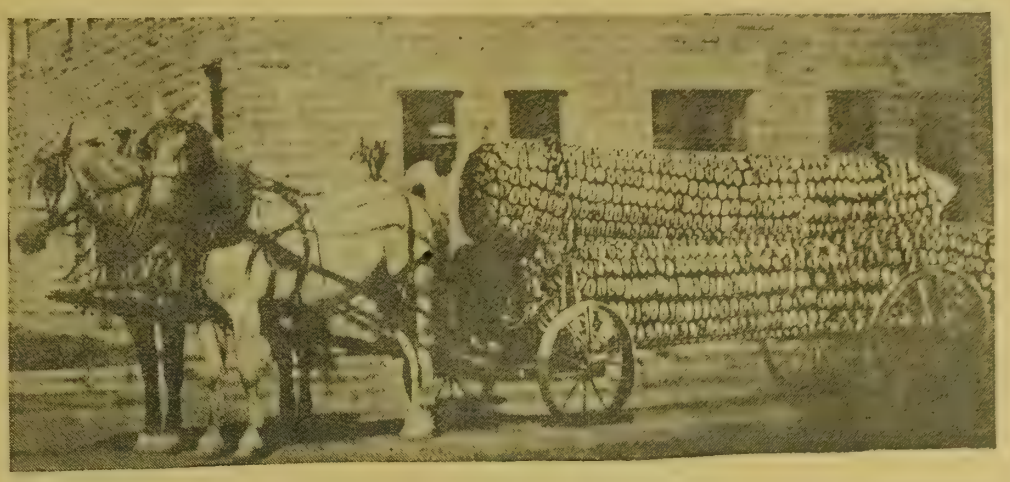
There is no doubt but that production in spring grain could be greatly increased by this pasturing with sheep in certain seasons where land is rich and not easily injured by treading. Such land is found to a greater extent on the prairies than elsewhere.

CORN CORN CORN CORN

Plant Eastern-Grown Seed Corn

Johnson & Musser Seed Co.

Up-to-Date Seed House



Iowa Silver Mine, Grown on the Rosemead Ranch by James Gooch from our Eastern-grown Seed.

We have just received our usual carload of Nebraska-grown hand-picked Seed Corn, and offer it at the following prices f.o.b. Los Angeles:

King of the Earliest, 85 days. The earliest Dent variety. Ears short, 12 to 16 rows, well filled. Grain long and yellow, making an extra quality meal. Per lb. 5c; 100 lbs. $3.50.

Improved Leaming, 90 Days. Ears are large and handsome, with deep, large grains; orange-yellow color and red cob. Per lb. 5c; 100 lbs. $3.50.

Pride of the North, 90 Days. One of the best sorts; ears have from 14 to 16 rows 8 to 10 inches in length, slightly tapering; color light orange. Per lb. 5c; 100 lbs. $3.50.

Minnesota King, 100 Days. A large-grained variety; yellow. Per lb. 5c; 100 lbs. $3.50.

Wisconsin White Dent, 90 Days. A perfect white Dent corn, of good quality, resembling the Leaming. Per lb. 5c; 100 lbs. $3.50.

Champion White Pearl, 90 Days. A fine white flint corn. Per. lb. 5c; 100 lbs. $3.50.

Early Mastedon. Having grown and sold the Early Mastedon corn four years, we recommend it as being decidedly the best of all Yellow Dent varieties. Every one who has seen it grow is enthusiastic in its praise. Large ears, deep grains, and as many as 24 rows on a cob. Eastern grown, per 100 lbs.$3.50.

The Iowa Silver Mine. A large White Dent. The grains are as large as the Hickory King, but longer, having a small cob. It is the most desirable of all White Dent varieties. Per 100 lbs. $3.50.

Red Cob, Ensilage. A large stalk with a profusion of leaves which makes it the most desirable for ensilage. Price, per 100 lbs. $3.50.

Stanford White Flint. An excellent White Flint corn. More prolific than the King Philip. It is an excellent extra early table corn. It has long ears and a small cob. Price, per lb. 5c; per 100 lbs. $3.50.

White Cap Yellow Dent. Exceedingly prolific and hardy, resisting drought much better than other varieties. Per 100 lbs. $3.50.

Reid's Yellow Dent. This is the variety that has been brought to a high state of perfection by the Illinois growers, and drew the medal at St. Louis because it averaged the greater number of pounds per bushel. Price, per 100 lbs. $3.50.

Kink Philip, 90 Days. A small yellow variety, very popular in this market. Price on application.

Hickory King, 110 Days. A white variety, having the largest grain with the smallest cob ever introduced in a white corn. Price on application.

Johnson & Musser Seed Co. 115 N. Main St., Los Angeles

HOW TO TREAT FOOT ROT IN SHEEP.

There has been a great prevalence of foot rot in sheep throughout the Northwest this fall, for which continued wet muddy weather is largely responsible, for filth of some sort is necessary to the production of this disease. When mud and dirt become permanently lodged in the foot, they occasion inflammation which ultimately causes the whole foot to decay, and make the sheep lame. It is possible to cure foot rot unless it is a prolonged or extremely serious case. First trim the toes off square, remove all dirt that is in the foot, and wash with an antiseptic. Any of the coal-tar sheep dips may be used. Then apply a salve made of lard, sulphur (or flour) and coal-tar dip, care being taken to have it penetrate all crevices that may appear in the foot, and bandage with a firm white cloth. Inspect in a few days and if not healed the treatment should be repeated. This is almost a sure cure if persistently followed—[Progressive Farming.

A scrub lamb was raised in company with a high-grade Southdown lamb at the Louisiana Experiment Station, with the result that on the same feed and care and in the same time, the scrub lamb gained 32 pounds and the Southdown 43. The former was 155 days old, while the latter was 129 days old. There is a moral to this experiment.

PERNICIOUS LEGISLATION.

Seldom have we noted a more profound mistake than was made by the late Legislature of Washington, in the enactment of a law which exempts all owners of money, mortgages, bonds, stocks, tax certificates, book accounts and bills receivable from taxation. Even more surprising is the fact that Governor Mead of that state has signed the bill, which has now become law. The reason assigned for this startling action by the legislators who pushed the bill to its passage is, that owners of monies and credits are prone to commit perjury when confronted by the assessor, and the exemption of the money-loaning class will tend to improve public morals by lessening the opportunity for the commission of perjury when the rich are called to list their property for taxation.

This reasoning is fallacious and pernicious, outside the fact that the law is strictly class legislation, and therefore unconstitutional. It savors most strongly of iniquity. Any law which lifts the burden of equitable taxation from one class and imposes it on another, is unjust and wrong.

Any law which is created to shield the rich and burden the poor, is iniquitious and bad. That is just what the tax-exemption law of Washington is, if correctly reported in the newspapers. The reason assigned is without standing in justice or morals. If the money-loaning class in Washington is so corrupt that it commits perjury to evade honest listing of its property for taxation, the legislators should have followed the example set by the Iowa law makers, and provided for tax inspectors, to go through the records of each county and ferret out property unlisted, in the way of mortgages, bonds, judgments, recorded stocks, etc., and return the same for taxation to the county treasurer; adding a penalty clause which is severe enough to act as a reminder for all future time to the party caught dodging his taxes. Or, the legislature might have amended the perjury act to make its provisions amount to confiscation to those who falsely swear to cover up their property.

Every individual owes his state government, and his municipal government, that proportion of financial support commensurate with his holdings. The city and state must protect the lives, liberty and property of all their citizens, and where one class, the most wealthy, at that, dodges its just proportion of taxation a proportionately greater burden is placed upon the producing classes, the farmers, owners of homes, the laboring man, the widow with her little holding, to make up the deficiency. The government owes allegiance to the citizen just in proportion as the individual supports the government, and no more. The man who shirks his obligations in a financial sense, is as much of a traitor to his country, as the man who preaches anarchy from the curbstones of our city streets. There is honor in neither. Both are unworthy of protection and both are moral and political outcasts.

Under this law as reported, the rich whose wealth consists of money, bonds, notes, mortgages, etc., will hereafter be a high privileged class, and will not be called upon to pay a penny with which to carry on the government which gives them protection. By reason of the loss of hundreds of thousands of dollars of heretofore taxable property, from the tax rolls, it will be necessary to greatly advance the tax rate on the farmers, merchants, mechanics and the working people who own their homes. This is "class legislation" pure and simple.

It is such laws as this that are fostering socialism. It is such laws as this that are breeding discontent among the laboring classes and weaning away patriots to the ranks of anarchists. Washington may gain some wealthy residents by the enactment of its "Tax-exemption Law," but its material and industrial building up will be correspondingly retarded.

ALCOHOL AS A SUBSTITUTE.

The manner in which the denaturized alcohol bill has been strengthened by the recent congress has led to the hope that that fluid may be profitably and cheaply employed as fuel and for the purpose of generating power. "This, at least, is the expectation of President Roosevelt, who has written to Senator Hansbrough, of North Dakota," says the Des Moines Capital, "who was foremost in urging the legislation expressing the opinion that the new law means much to the farmers of the northwest." A recent bulletin issued by the department of agriculture, covering the results of a series of tests on alcohol as a fuel for gas engines, bears out this view very markedly.

The bulletin declares that any engine on the market today operating with gasoline or kerosene can operate with alcohol fuel without any structural change whatever, with proper manipulation. Practically the same thermal efficiency is obtained with alcohol as with gasoline. Engines constructed specifically for the consumption of alcohol can be sold cheaper per horse-power than the gasoline engines now in use, and the storage and use of alcohol will be vastly less dangerous. One of the most attractive features of the new fuel will be its comparative odorlessness, which will be a boon not only to the autoist, but to the general public. "In localities where there is a supply of cheap raw material for the manufacture of denatured alcohol," says the bulletin, "and which are at the same time remote from the source of supply or gasoline, alcohol may immediately compete with gasoline as a fuel for engines;" but, it concludes, "in most localities it is unlikely that alcohol power will be cheaper than or as cheap as gasoline power for some time to come."

It is the opinion of the men who conducted the tests in question that on account of its greater safety and adaptibility to the work, alcohol should immediately supplant gasoline for use in boats, and the possibility is voiced that in time the alcohol engine may entirely supplant the gasoline and kerosene types.

EVILS OF BOILED WATER.

The declarations made by health boards and physicians that our drinking water may be made pure by boiling, receives a serious set-back by a distinguished physician of France, who, in a translation made for the Literary Digest, states that boiling water does not completely sterilize it, but renders it unfit to drink, and frequently results in many troubles of the stomach and bowels.

We all know that boiled water has a flat, insipid taste, but we have endured this because we have been led to believe its hygienic properties were enhanced. But it seems in this we were wrong. According to the authority quoted nothing will kill living germs in water but heat under pressure sufficiently intense to change its character without destroying its valuable compounds. Says the writer of the article: "The purification of drinking-water, from the bacteriologic point of view, presses upon the attention of hygienists with undeniable force. Numerous processes have been devised and proposed to this end. Some are based on various kinds of filteration, others on the use of properly selected chemical substances, which bring about the coagulation and precipititation of the organic matter, as also the destruction of the disease germ; finally, there are others that require only the use of heat for the desired sterilization. The last are, in the present state of science, the only ones that present all the desirable guarantees and give results that are absolutely perfect from the biological standpoint. But their application is not exempt, in practice, from a certain number of serious inconveniences.

"When we are content, as often happens, with boiling water, we obtain only a partial and quite illusory sterilization. It is true that heat is the surest agent of sterilization and that no living organism can resist a sufficiently high temperature; but although most of the microbes are killed in a few minutes by heating to the boiling-point, certain spores require for their destruction a sensibly higher temperature. Our uncertainty on the subject of the sterility of boiled water is the cause of its lack of trustworthiness in surgery; it is also the reason why we can trust only partially in its harmlessness in the preparation of food. Also, even admitting that boiling sterilizes the water this does not make it a perfect beverage, because, in the first place, it is totally deprived of the air which water normally holds in solution, and is made heavy and indigestible by this lack of aeration; and i nthe second place, the carbonates of lime are precipitated, which injures its flavor; and finally, the earthy matters in suspension are also precipitated and make it insipid.

"To obviate these many disadvantages, we must in all cases avoid water that has been simply boiled, and use water sterilized by heat under pressure, which alone is able to answer all hygienic demands. Numerous devices have been invented for its preparation; without taking time to describe them, it suffices to say that they should, if they are properly constructed, raise the water to a temperature of 130 deg. to 150 deg. C. (266 deg. to 302 deg. F.), prevent the escape of the dissolved air, and not allow the precipitation and seperation of the soluble compounds. When these various conditions are fulfilled, and only then, water, sterilized, from the microbiologic standpoint, retains its organic properties and remains absolutely drinkable; it is both easily digestible and perfectly harmless, which is never the case with water that has been simply boiled.

"It is desirable to make public the faultiness of boiled water, which is too often regarded as excellent, and which is nevertheless the cause of numerous maladies—severe stomach troubles, intestinal infections, frequently dangerous, and various types of surgical septicemia. All this is in spite of the classic injunction, 'boil your water,' which should be regarded as a makeshift and not as an exact and all-sufficient rule."

The spectacle of wholesale graft presented in the San Francisco disclosures, will make the country think that the earthquake and fire were a retribution sent to cleanse the city.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Sixty to a hundred cases of eggs a day are being shipped from Chino.

Escondido shipped last week 941 pounds of butter and 2700 pounds of cream.

The heavy rains in all parts of the south have literally put the stock in clover.

It is feared the late heavy rains will damage the bean crop in Ventura County.

Olive cabbage growers say that a large per cent of the early cabbage has gone to seed.

Milk dealers in Los Angeles are being prosecuted for violation of the pure food law.

A successful milking machine is being operated at Donlon Bros. ranch between Hueneme and Oxnard.

Holtville farmers, who recently organized a cooperative company, have awarded a contract for building.

In 1906 California produced 1,994,814 bushels of corn; 26,883,662 bushels of wheat and 5,156,298 bushels of oats.

The express poultry shipments from Escondido for the week were 1723 pounds of chickens and 198 cases of eggs.

The Imperial cheese factory makes 100 pounds of domestic Swiss cheese per day and it brings 19 cents a pound.

Babi & Van Horn Brothers are shipping 1100 pounds of Swiss cheese from their factory at Imperial to Los Angeles.

The California and Mexico Land and Cattle Company has brought in fifteen more cars of cattle for its range below the line.

C. E. Tait, of the Department of Agriculture, who has been making his home in Riverside for some time, is to be stationed permanently in the Imperial Valley.

The Townsend-Dayman Investment Co. has decided to subdivide 700 acres of the tract west of the Southern Pacific railroad a short distance west of Newport Beach.

Cannon brothers, of Imperial, have just harvested 1¾ tons of alfala per acre from their land for the first cutting of the season. The seed was sown a year ago.

Hay dealers of Los Angeles met and organized the Los Angeles Hay Dealers' Association, which will be an adjunct of the Los Angeles Merchants' Exchange.

The Erand Brothers of the San Joaquin ranch shipped 600 head of sheep yesterday to the Houser Packing company of Los Angeles. Sheep are bringing now something like $7 a head.

El Monte will have a large acreage planted to potatoes this year. The latest to embark in this line is Mr. Hollihan, who will put in 100 acres. The soil in this vicinity is especially adapted to potato raising.

The theory of the rapid decline of Salton sea is being verified, it having fallen seven inches to date, says the Imperial Standard. At this rate it soon will be out of reach of the railroad, even with heavy winds.

Wells west of the Santa Ana River that have not flowed in eighteen years are now flowing. The long rainy spell has had its effect on the underground flow for several weeks, but within the last few days the artesian flow has been geatly strengthened.

Dr. W. C. Rayen, county veterinarian, has been advised that the Department of Animal Industry has delegated Dr. S. J. Radibaugh, Government Veterinary Inspector, to come to Riverside county and assist in the eradication of Texas fever now infesting stock at Rincon.

If you want to get in, cut in;
If you are not yet in, butt in.
Show the world how fine your fettle,
Try a WANT AD., show your mettle.
If success won't set in, cut in.
This is how to get in: Butt in!

HORTICULTURE.

Apricot men aver the crop in Orange county will be light the coming season.

A number of Orange county's largest apricot growers have replaced their apricot trees with walnuts.

Southern California has been visited by an equinoctial storm this week, considerable thunder accompanying.

New baled alfalfa hay is coming to town, Imperial valley undoubtedly leading the world in this product.

A big strawberry warehouse is being erected by the big Jap colony just north of the power-house at Arcadia.

A Cultivator representative now in Ventura county, reports few or no apricots this season.

The movement or oranges the past week has been exceptionally good. Between 25 and 30 cars were sent from Ontario.

The San Joaquin Fruit Company of Santa Ana is now preparing considerable acreage for the planting of orange and lemon trees.

At Elsinore a carload of oranges were shipped from the Lakeland ranch and a car of lemons from the Truell ranch last week.

J. M, Beck of Chino is setting out fifty acres of walnut trees for five different parties on adjoining tracts north and east of town.

Riverside shipped 272 cars and three cars of lemons last week. Total output of oranges and lemons for the season is now 2152 cars.

Work is being crowded on the Monrovia fruit-preserving plant, and it will be in operation in about twenty days. It was recently capitalized for $50,000.

The Towsend-Dayman Company made arrangements two weeks ago for the planting of 2000 walnut trees on their Newport Heights tract in Orange county.

The cool nights, with some frost of last week, was a boon to the citrus fruit in some sections. It is now in excellent condition for shipping with very little puffing.

The alfalfa growers of Chino and the surrounding country held a meeting Saturday evening at the Chino hall to organize an alfalfa growers' club to regulate prices.

The south is gradually going out of the apricot business, not because excellent crops cannot be raised, but because other branches of horticulture offer greater profits.

They are very busy at the Tustin Packing Company this week. They have shipped eight cars, consisting of three seedling oranges, four navel oranges and one of lemons.

Thirty thousand oranges were put through the new wrapping machine 265 times and they came out "absolutely perfect" at the last run during a trial at Riverside.

The apricot crop is practically gone on the San Joaquin Ranch, and the ranchers have been interfered with so much by the wet weather that many acres of land will not be planted.

There is still in Highland about a fourth of the orange crop, and at the rate cars are being given it will take till the first of June to get the fruit off the trees and into the Eastern market.

There are more complaints coming into this office from the districts that are using distillate in the orange orchards of spotted fruit; oil is not good for the trees and the damage from it is far greater than the expense of fumigation.—S. A. Pease, San Bernardino.

Dr. R. H. True, government physiologist, who has been here in the interests of the United States Department of Agriculture investigating the lemon, left this afternoon for Reno, Nev., where he takes up a line of experiments with drug raising in that section. Dr. True says he expects to return to Riverside next year.

Northern California

AGRICULTURE.

Kern county is to have an ostrich farm.

The Feather river is at the highest stage ever known.

Reclamation district No. 70, in Sutter county, is flooded.

The principal business street of Oroville is under six feet of water.

At Tulare about one quarter million dollars was paid to dairymen in 1906.

The Sacramento river has left its banks and is spreading over miles of territory.

The Lucerne creamery is now turning out about 3000 pounds of butter per day.

F. W. Koehler, of Kirkwood, reports sheep and other stock doing well.

A carload of cattle escaped from the train between Gazelle and Redding—twelve beeves are missing.

The land near Brighton was flooded and the farmers have driven their cattle to higher ground.

The residents of Elmira and vicinity are beginning to take an interest in alfalfa growing and dairying.

The frost of last week did much damage to deciduous fruit and early vegetables at Bakersfield.

For the first time in twenty years Santa Clara county farmers are admitting that there can be too much rain.

The flooded reclaimed district No. 108, south of Colusa, contains 75,000 acres of the richest land in the valley.

The principal damage from the floods about Sacramento will be in loss of stock, much being undoubtedly drowned.

On the University farm near Davisville the creamery building is ready for shingling and the foundation for the stock pavilion is laid.

Practically all of the town of Biggs is under from one to three feet of water. The Southern Pacific tracks are under water for miles north of Biggs.

Sam Barger sold to John Russel, Wednesday, 30 hogs that tipped the beam at 6000 pounds for the bunch. The price was 8 cents a pound.—Hanford Sentinel.

The Registered Holstein bulls Sir Josephine Hartog Gerben, Sir Mercedes Mechthilde Josephine were sold last week by J. H. Williams to Pioneer Land Company, Porterville.

The Corning agent for Wells-Fargo's Express Company, reports the shipment this week of 3020 dozen eggs, 24 dozen chickens, 3000 pounds butter, and about a ton of turkeys.

J. C. Rice, of Hanford, had a bunch of wheat pulled from his ranch, the stalks of which are a yard long, the heads large and well filled. Pretty good for St. Patrick's Day, isn't it?

The Sacramento River reached the highest point ever known at Colusa—29 feet 4 inches—when a break occurred north of Princeton in the levee south of Colusa, which caused the river to recede rapidly. Water from these breaks flooded a vast area of farming land and will cause a million dollars loss in Colusa county.

TOWN KILLERS.

There are several kinds of town killers and every town is afflicted with one or more of the different specimens.

1. There are those who go out of town to do their trading.
2. There are those who are opposed to almost all kinds of employments.
3. There are those who seem to imagine that they are the sole proprietors of the town.
4. There are those who take special pride in belittling and deriding all public-spirited men.
5. There are those always ready to stand out in open opposition to any movement not originating with themselves.

And there are those who delight to turn the cold shoulder to and seek to injure the reputation, character or credit of their neighbor.

HORTICULTURE.

The apple growers of Sebastopol are planning to organize.

The Truckee river has reached the highest mark in its history.

There will be 1000 acres of new vineyard planted this season in the vicinity of Arbuckle and College City, in Colusa county.

One Fair Oaks grower has shipped from his orange trees this season 1515 packed boxes of oranges.

The Sacramento valley is in the grasp of the worst flood that has ever been registered in its history.

Not since 1862 has there been anything like the high water throughout the San Joaquin and Sacramento districts.

Stockton reports the worst floods since 1862, and the whole city is flooded, the business portion being under water.

The village of Dredgeville, near Oroville, has been entirely swept away by the flood waters of the Feather river.

The Government barrier at Brown's valley, twenty miles east of Marysville, broke and 600 feet of the embankment has washed out.

J. B. Wrangham, near Sacramento, sold this season from nineteen trees four years from planting, one-year-old stock, $24 worth of olives.

Howard Buffum of Sacramento county sold from six acres of olive trees not ten years old nineteen tons, giving more than $100 an acre.

At San Lucas the crop will be principally barley with indications of the best crop in twenty years; and the same may be said of King City.

The frosts of Tuesday of last week, did much damage, says a Fresno dispatch; 20 to 50 per cent. of the peaches and nearly all apricots are killed.

A force of 60 Japs is at work on the Italian-Swiss colony, south of Lemoore, setting out wine vineyard. About 150 acres have already been planted.

That there will be the greatest flood this spring or early summer in the vicinity of Tulare Lake, widespread damage to farming lands is a matter of little doubt.

The early age of olive-bearing trees about Fair Oaks, shows how well suited this locality is for the olive industry, some trees produce $1.50 each of olives the fourth year.

This season has been a most unfavorable one for the olive in the north. The early frost spoiled the olive for pickling and reduced the price more than one-half.

The Eucalyptus Forestry Company is the name of an incorporation at Fresno formed for the growing of Eucalyptus and other trees and shrubs from which valuable by-products can be extracted.

Bridges are all under water, and hundreds of acres of land are under water in Northern Solano county. Owing to the continuous rains farmers are very much discouraged, and not more than 65 per cent. of the acreage has been sown to grain.

The Hanford Experimental Forestry Company took out Eucalyptus for setting on a 35-acre tract Monday. This has been a fine season for planting the tiny trees which have been raised here from the seed. The company now have about 60,000 trees of different varieties planted and the future promises much.

Sheep are selling in the Northwest for the highest prices known for thirty years. Word comes from Linn County, Oregon, that sheepmen are receiving as high as $6 and $7 a head, and spring lambs a few weeks old bring $2.50 each. Those who purchased bands of sheep a few years ago are reaping small fortunes. L. M. Powell, of Albany, Oregon, recently sold 6000 stock sheep in Montana at $5 a head, and is holding 30,000 for better prices.—N. W. Horticulturist.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

POSSIBILITIES OF A "BEACH LOT."

I HAVE written of the possibilities of a town lot in the way of keeping chickens; of the improvements which can so often be made on a farm in the profits of fowls; now I would like to tell for the encouragement of others about the achievements of a resident on the ocean beach.

In response to a letter from Venice, "Venus on the Sea," as some of its residents call the charming beach resort on the Pacific Coast near Los Angeles. I went to visit a sick hen (professionally.)

The description of the illness was rather vague, and here let me say when any of our readers are in trouble with sick hens and want some advice that I beg of them always to mention the breed of the afflicted fowl, the symptoms, the food, the method of feeding, the way they are housed and anything that may help me to diagnose the case.

The letter reads: "I have found your articles more than helpful to the amateur chicken raiser and thanks to them so far have lost none by disease.

"I have a White Leghorn hen now, which puzzles me so that I appeal to you. There seems to be a large puffy swelling in her comb, at the base it is fully an inch wide, some puffiness around the eyes and a generally pale appearance. She keeps nodding her head as if in pain. She seems altogether dejected. Her general health is otherwise good.

"My chickens are at the beach on the sands where people told me I could not raise chickens, but so far, one year, I have been very fortunate and everyone comments on the niceness of my flock.

"In answering this, kindly omit my name."

The owner of the sick hen lives in a beautiful little bungalow on the very sands of the ocean, almost within reach of the spray. She has flower beds round the house, narrow beds, for all the soil has to be brought from the loam on the hills; the flowers looked thrifty, especially the great variety of nasturtiums. The exterior as well as the interior of the house showed cultivated taste and attention to little details which augured well for the care of the fowls, so that when the charming mistress led me to the tiny backyard I was not surprised to see two neat pens for the fowls, each with its hen house open entirely at the bottom and a doorway on the side away from the prevailing breeze. The little houses and fence whitewashed. Each yard had a trap-door opening on to the sands and I learnt that the hens at day break, before the rest of the family are up, go out upon the beach to take their morning constitutional scratch, for a few handfuls of wheat are scattered on the sands to reward the early birds for their earliness. There were plenty of little shells on the sand, fine enough for the hens to swallow, but they still were well supplied with grit in boxes, as their mistress found without extra grit to grind the food the egg-shells were too thin. The hens had had a load of oat straw to scratch in outside the fence; this kept them very nice and clean, but old "Boreas" one stormy night had carried it out to sea, so they now have to be content with dry sand instead of straw. They are fed scraps from the table with plenty of green food, and all the milk, sweet, clabbered and curd that they want, a plentiful supply.

"I had 190 eggs a month from eight hens for three months," said their little mistress, "so now I am keeping twenty hens and I am putting down eggs in water glass according to your directions."

The hens all looked thrifty and well and I noticed they had a large box of ashes from the cook stove and the open grate to bathe in and so keep themselves free from vermin.

"The lice gave me some trouble," explained the little hen wife. "I was doing so well that I thought I would buy some more fowls, so I sent to a commission house in Los Angeles for some, they looked all right, but in a few days developed roup and they had lice, which in a short time affected the whole flock."

It is never safe to bring in strange fowls, roup and other ills are propagated by this means.

I noticed that part of the little yard was fenced off with two-inch chicken wire and a tiny garden made in the enclosure, in which were small rows of early vegetables, radishes, lettuce, peas and beets or Swiss chard. The sight of the tender green of these vegetables was an irresistible temptation to the fowls and several of them in their attempts to reach the greens had wounded their combs, which were cut by the wire.

That was all that ailed the sick hen, an end of the wire had deeply penetrated her large comb; she is a Leghorn, it had inflamed and swelled to double its size near the head, the fowl had suffered greatly, but the swelling was now going down and the place was healing of its own accord, aided by nature and the vigorous constitution of the hen.

Bathing a wound like that with peroxide of hydrogen or even with vinegar and water when it first occurs, is often of great assistance, but as all the wounds on these hens seemed old I advised anointing them with a little carbolic salve or carbolated vaseline. Wounds or slight abrasions of the comb very frequently result in chicken-pox and the cure for that is carbolic salve.

Chicken-pox is a germ disease. The germ has to find entrance in a slight abrasion, so that if the germ of the pox is floating in the air or is on other chickens it will find entrance in a wire cut, or a wound from fighting birds. This is very frequently the case where there are cockerels that fight, or the germ may even insinuate itself through the bite of a flea or insect of any kind, hence carbolic salve applied to a wound will often prevent or cure the chicken-pox.

Injuries to the comb and wattles are more or less common and are usually the results of fighting or getting caught in the wire or lath divisions of the house or yard. Sometimes a thin comb is nearly torn off, or a wattle badly split. To avoid deformity the parts should be brought closely together and stitched with a needle and fine white silk, each stitch being tied separately. The blood supply is so good that even though three-fourths of the comb be torn, stitching will result in the rent healing nicely and presenting a good appearance.

The bird should be isolated, as the rest of the flock will be apt to pick the wound and acquire bad habits. I have used "New skin" the liquid court plaster, on a wounded comb with excellent results. It entirely prevented a scar.

One word more before we leave the shore. To those who may contemplate having a few hens on the beach, I would say that this lady has found the Leghorns more hardy in her little place than the Orpingtons.

The narrow line between success and failure must be carefully watched. Even a straw will show which way water flows.

"Why do Leghorns do better with me than Orpingtons?" was the last conundrum asked me.

There may be several reasons for this. Possibly there may be a weakness in that particular family or strain, as we call it of Orpingtons, inherited from sickly ancestors, or it may be that the Leghorns being what we call "close feathered" or "hard feathered," their feathers lying closely or tightly to their bodies can withstand the wind and spray better than the Orpingtons with their softer, looser feathers. Or it may be that the smaller fowls not presenting as large a surface to the wind were not affected by it as much as their larger cousins. These Orpingtons had swollen joints, their owner said, and crooked bones. I think it came partly from inherited weakness and partly from the buffetting of the cold winds.

INCUBATOR TESTS.

I made a number of incubator tests one time that demonstrated some points in artificial incubation that I have never seen in print, viz.: that Leghorn eggs will make a good hatch on a lower temperature than it takes to hatch Plymouth Rocks or Brahma eggs. I know exactly wnat I am talking about in this instance. My tests proved it beyond my expectations. My expectations were gathered from the nature of the fowls and the difference in the size of eggs, also from little points gathered through observing the results in making hatches of mixed eggs.

My test was made with six 100-egg incubators. They were made exactly alike and all run alike in the same room and under exactly the same conditions. Before starting I tested the thermometers to make sure there were no fractions in differences. I set three machines with Brown Leghorn eggs and three with B. P. Rock eggs. I set each machine three times. The test was made in the months of May, June and July. Ran the temperature on the Leghorn eggs in one machine between 101 and 103, on another at 102 to 104 and on the other 103 to 105. I duplicated the plan on the three machines filled with Plymouth Rock eggs.

The lower temperature made the best hatch on Leghorn eggs while the higher temperature made the best hatch on Plymouth Rock eggs. For the second test I reversed the machines, that is, I took the one that had been run on the higher temperature and ran it on the lower temperature, made this reverse with both sets of incubators. The results came out as before. The higher temperature made the best hatch on Plymouth Rock eggs while the lower temperature made the best hatch on Leghorn eggs. With the Plymouth Rock eggs there was only a small per cent. in favor of the higher temperature over the middle temperature, but with the Leghorn eggs the lower temperature made a great gain over the middle temperature.

The third trial emphasized the results. This is the first time I have ever spoken of these particular experiments. I made the experiments to test an idea formed while watching incubator results on different kinds of eggs and through studying the nature of the sitting and non-sitting varieties of poultry. I am thoroughly convinced that there is fully one degree difference between the right temperature for Leghorn eggs and the right temperature for Plymouth Rock or Brahma eggs. My convictions are that two degrees difference between Leghorn eggs and Brahma eggs is about correct.

It is the experience of all incubator operators that Leghorn eggs hatch a day earlier than Plymouth Rock eggs in the same incubator. The same thing invariably happens in a hen's nest, yet a Leghorn that will set on her own eggs will hatch in 21 days, and the same of the Plymouth Rock. On first thought the difference in temperature seems queer, but if we extend the thinking and reasoning, it is not so queer after all.

It is a fever that makes hens broody. The larger varieties are more inclined to broodiness, the fever is higher. With the larger body, the heat is greater in proportion to the feathers. It is a hard matter to find opportunities to take the temperature under a setting Leghorn; only once have I ever been able to do so on account of the wilder nature and the sensitiveness in having things other than eggs under her, but in the one good test the temperature showed 102 on the eighth day. On the other hand I have known the thermometer to show as high as 106 on the twelfth day under a Plymouth Rock hen. In dozens of tests the thermometer has shown 104 after a week's incubation under the larger varieties. Let me further say that as a general rule, the best results are obtained with incubators with a degree higher temperature in a cold room than in a warm room. This difference is due to the bottom of the machine being colder in a cold room. Remember, I write this for the good of incubator operators instead of to boost particular incubators.—M. M. J.

THE EGG BASKET.

The best prices for fresh eggs are obtained during January and February.

The fat hen lays the smallest number of eggs.

Never allow a bad egg to find its way to the egg basket.

It costs about one cent each to produce eggs.

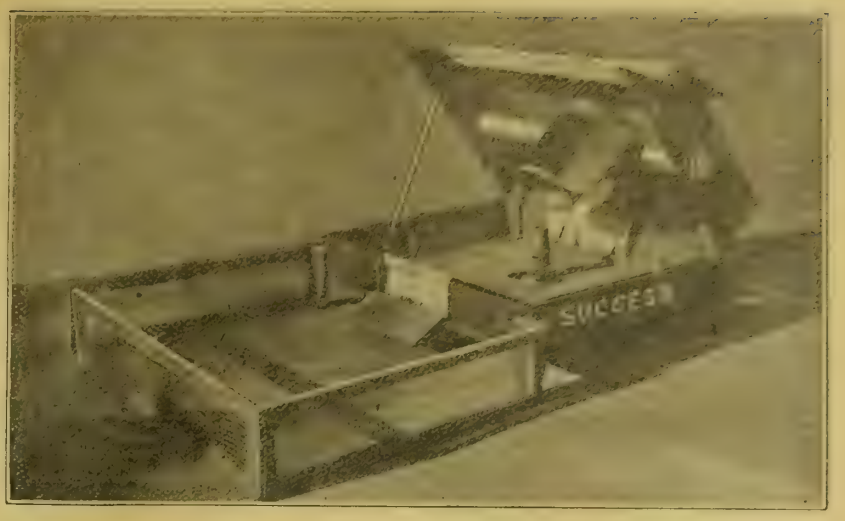
Always clean your eggs before marketing them. This should be done with a dry woolen rag.

Never scare the hens or allow anyone else to do so, as it reduces the egg production.

Don't try to sell preserved eggs as fresh. It may cost you the loss of a valuable customer.

Eggs over one week old should never be kept for hatching.

Crushed charcoal fed once or twice a week is invaluable in warding off indigestion. Hens that have access to the ash pile will pick out the small bits for themselves. Nature tells them that it is good for them.



"Success" Brooder

Best and Cheapest. Center heat, perfect adjustable ventilators, patent safety lamp. Made of clear redwood. For use either indoors or outdoors. Easily cleaned. **Sold on trial.** Send for illustrated circular.

We also make the **"Old Trusty"** incubator, a machine that will hatch more eggs than any other incubator on the market. Catalogue tells the complete story. Send for it and get our **Free Trial Offer. Write today.**

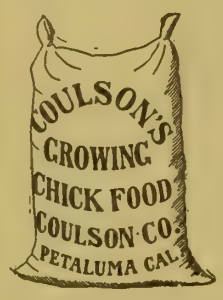
Coulson's Growing Chick Food



Coulson's Growing Chick Food is a balanced ration of cracked grains, seeds, mill feeds, meat and bone meals, carefully mixed according to a formula which has been compiled only after much experimenting.

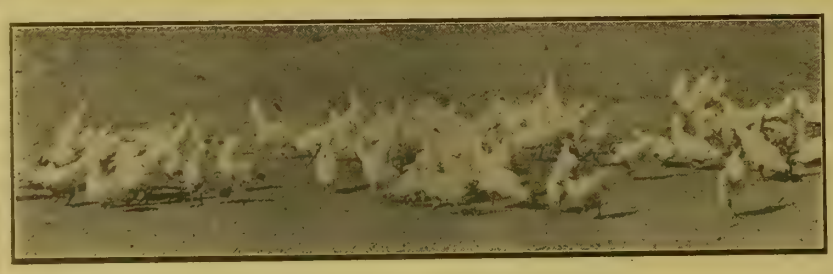
It contains everything that a young chick requires up to three months old, and can be fed either from the commencement, or to gradually supersede **Coulson's Special Dry Chick Food,** say four to six weeks old.

It can be fed until the chickens are three months old, when you can commence feeding **Coulson's Improved Mash Egg Food.**

When making the change from **Coulson's Special Dry Chick Food** to the **Growing Chick Food,** it will be found best to do so gradually, changing one meal at a time.

If you will feed **Coulson's Growing Chick Food** to the chicks they will be fully nourished, and they will enjoy their feed. In consequence they will grow rapidly, and mature quickly.

ASK YOUR DEALER FOR IT.



Flock of three-months-old pullets fed on **Coulson's Special Dry Chick Food,** and afterwards on **Coulson's Growing Chick Food.**

One of Our Numerous Testimonials

"I tried **Coulson's Growing Chick Food** exclusively the first year in the business, on Brown Leghorns. Sold the cockerels as broilers at 9 weeks old, weighing 2 pounds, 3 ounces each.

"I tried my own mixture of food the next year, and took the same care of the chicks, as near as I knew how; and sold 75 cockerels as broilers, weighing 1¼ pounds each at same age.

"Having tested at my own expense the two methods, I have concluded the **COULSON FOOD** is superior."

SIMON MAIER PACKNG PLANT.

NEARING completion the Simon Maier Packing Company have one of the most extensive packing plants west of Chicago. Its capacity is a three million dollar business annually. It can kill and care for, when finished, about 2500 head of cattle, sheep and hogs daily. The main building is five stories high, constructed of reinforced concrete. The floors, walls, ceilings, and supports are of solid cement. The buildings are fire-proof, the sanitary conditions are as perfect as architectural skill can provide. Inspectors from Washington pronounce the structure one of the most modern in appointments of any similiar plant in the country. Few California people have knowledge of the immensity of the packing industry in Los Angeles. In a future number the Cultivator will speak at length of it.

ABOUT FARM POWER.

THE simple gasoline engines manufactured by the International Harvester Company are doing much in revolutionizing farm work. Many is the place they are now employed where formerly slow, laborious hand labor had to be resorted to. There is hardly any limit to the times and places where power of some kind can be used on the farm. With the perfecting of gasoline engines a long step was taken toward the lightening of farm burdens. With the perfecting of the I. H. C. engines, the farm power problem was completely solved. These engines were made not only reliable, but also simple, so that farmers, who are not supposed to be mechanics, could run them. The I. H. C. engines quickly made the tread mills and the old fashioned horse-powers a thing of the past. I. H. C. engines furnish an economical power, because they use little fuel. They can be adapted to use alcohol as well as gasoline, and therefore are destined to be run cheaply. They can be had in many sizes, such as can easily be moved from place to place, and are especially adapted to light work.

Local International agents can supply catalogs and give particulars about these engines. If you need power or want to post up on power questions, call and take up the question with them.—Authorized notice.

COLUMBUS ENGINES TO THE FRONT.

GREENLEAF-COMPTON COMpany, Pacific Coast Agents for Columbus engines, located at No. 121 South Los Angeles street, report an excellent trade on Columbus engines so far this spring. The third carload has left their factory at Columbus, Ohio, for Los Angeles, and more are to follow as soon as they can be shipped.

They are installing two miles from Anaheim, a sixty-horse pumping plant for E. B. Berry, and when completed will be one of the finest plants in that vicinity. They are also building a rock-crushing plant for the United States Granite Pressed Brick Co., of Los Angeles, which will take a sixty-horse Columbus engine for the motive power.

Columbus engines have been in the field for sixteen years, and their output is one of the largest in the United States.

The reliability and economy in running, as well as the simplicity in construction, puts them at the top notch when gasolene or distillate engines are under consideration.

EGGS NO GOOD.

MR. M. A. Schofield, of Gardena, says that owing to the poor class of eggs sent, he will not hatch for the public in general as he anticipated but will sell chicks from the hatchery, which will be more satisfactory to all concerned. To use his own words; "We have been receiving eggs of all ages, sizes and breeds, ill-sorted and badly packed, making good hatching an impossibility."

NEW HERD.

THE Peabody-Wall Company have purchased the Lugo Ranch, Lugo Station, Santa Ana Electric Line, from the Sterling Milk Company, and are engaged in breeding thoroughbred Jersey cows and Berkshire hogs. Their strain includes the best in Southern California. They already have some young stock for sale, as will be noticed by reading their advertisement, page 339.

Maier Packing Co.'s New Plant
Finest in the West. Referred to on this page.

A CARD OF THANKS.

We desire to thank the numerous readers of the California Cultivator who deal with us, for their many evidences of good will shown us during the past few weeks.

The broad publicity given to the indiscreet affairs of a former employé of the house has been most distasteful to us and calculated to injure a firm with less reputation, as we do not consider such notoriety valuable advertising. But we are glad to say that our business has gone steadily on meanwhile, and many improvements under way are being carried to completion. Our factory is being greatly enlarged, and several new catalogues are now in the works. Two of them, our Gun and Ammunition catalogue and our Tent and Camping Goods catalogue will be ready for distribution within 60 days. Each of these will be the handsomest of its kind ever issued in the Southwest, and will add greatly to our circulating library. A simple request for either of these will land it in your box postpaid.

Again thanking you, we remain,
Yours very truly.
The WILLIAM H. HOEGEE CO.

ROAST MUTTON.

The shoulder is the best piece to roast. Have the butcher remove the bones, leaving a pocket for bread dressing. Remove all the pink skin from the outside, then season with salt and pepper. Season the bread crumbs with sage, salt pepper and melted butter and milk. Place in the baking pan and bake in a moderately hot oven. The meat should frequently be basted with the meat liquor in the pan.

THE BUFF WYANDOTTES.

For an all-around bird there is nothing that excells the Buff Wyandottes. They have utility, fancy and beauty combined. Their color is pleasing to the eye and does not soil and yet they are not too dark to be attractive. They, of course, have all the other good points of the Wyandottes.

A few years ago one didn't hear much about the Buffs on our coast, but I notice of late that they are coming to the front and run a close second to the Whites and are in great demand. The new standard demands that the color be a rich golden buff. The fancier is breeding to get that soft even buff characteristic of high-class breeding and free from any foreign color whatever. The under color must be a rich color of a little lighter shade. A breeder sometimes makes the mistake of mating birds of too great a contrast in color and the result is birds of mottled or mealy appearance. Therefore to get the best results one must choose birds as near standard color as possible and mate them with males a very little lighter than the females.

From a 94 1-2 point hen very even in both under and surface color and a little dark in the tail, mated to a 93 1-2 point cockerel near standard color, but a little lighter than the hen, I got some very fine solid buff pullets with absolutely no foreign color. These pullets are now mated up with a suitable male and I am expecting great results from them this year.

I hatch a good many chickens, but cull very closely, selecting the most vigorous birds that show good points, such as stocky yellow legs, good comb, rich bay eyes and even color. In mating up my birds I select the best layers that score the highest and my yards contain only my best birds and all are good layers.

Pens should contain only birds that are well up in standard requirements or our stock will go backward instead of forward.

It is not quantity we are after, but quality, and a few good birds will pay better than twice as many half good ones; and we mustn't forget when breeding for color and shape that it's quite as important to produce good layers. I find a ready market for stock and could sell a great many more eggs than I am getting right along.

I am predicting a great future for the buffs and feel that they are the coming bird. I am a member of the American Buff Wyandotte Club and I'm glad to see a great many of our western breeders are coming in.—Arthur W. Huskins.

HE FOOTS THE BILL.

One time a merchant put up a blackboard in his store and asked his customers to write their names on it and opposite tell what they were doing for humanity. A lawyer wrote, "I plead for all." A preacher wrote, "I pray for all." An old farmer walked up and wrote his name, scratched his head a while and then wrote, "I pay for all."

Here's to the stork,
A most valuable bird,
That inhabits the residence districts.
He doesn't sing tunes,
Nor yield any plumes.
But helps out the vital satistics.

You can show a Boston man, but you can't show him much.—Missourian.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

To Candy Kumquats.

Please inform me in your paper, how to preserve or candy the little kumquat orange.—H. E. S., Nordoff.

While I have not been fortunate enough to have kumquats to handle I have many times preserved and glaced small oranges and limes. I should not hesitate to use the same formula for kumquats. It is as follows: Wash the fruit, wiping it dry with a clean cloth. Weigh the fruit carefully, and place it in a wire basket, one used for frying will answer.

Place the basket of fruit in a kettle of cold water, to the cold water add a heaping tablespoonful of baking soda for each gallon of water contained. Bring to a boil and then set where it will simmer for twenty minutes, when the peeling looks cooked it is done, for it is not desirable to cook the pulp of the fruit or it will not stand up firm under the sugaring.

Lift out the wire basket and plunge it at once into cold water, changing the water as it grows warm. This is technically known as mordenting with soda it keeps the fruit from growing dark. It is often used in making marmalade from oranges and lemons.

Weigh out as much sugar as the fruit weighs, put on three-fourths of the sugar with as little water as will dissolve it, boil and skim it carefully.

The French makers put one pound of glucose for every nine pounds of sugar used. A preserve made with this amount of glucose will never crystalize and grow hard.

Boil the syrup for fully ten minutes then skim carefully, stand where it will keep hot. Drain the cold water off the fruit and place it in shallow pans not more than two kumquats deep.

Pour the hot syrup over the fruit and cover with a cloth or board so the heat will be held for a couple of hours then remove to a cold place and uncover the fruit, to have it as cold as possible before next morning. The principle of forcing the sugar into the fruit is based on the changes of temperature that swells and shrinks the fruit.

The next morning pour off the syrup and put it on to boil again, when hot add the rest of the sugar, boil five minutes, skim and pour over the fruit while hot, cover as before. The next morning cut one of the kumquats to see if the sugar has not nearly penetrated to the center, if it has almost reached the center the fruit is ready to be finished at once. If it has not repeat the boiling of the syrup the next day.

When the fruit is ready, the syrup is put on the fire to boil again. The fruit is carefully packed into either glass jars or tin cans by hand. When the jars or can are full spring in the top some little sticks, orange wood peeled or any tasteless wood, these are to hold the fruit down in the jars.

If glass jars are used, place a folded cloth in the bottom of the wash boiler, put the jars having the cold fruit in them on the cloth in the boiler, put in a dipperfull of hot water into the boiler then fill a little syrup into each jar, adding hot water on the outside from time to time as the boiling syrup is put into the jars. When filled rest the cover lighly on the jars and as soon as the syrup in the jars boils, lift them out and screw up. Keep the jars in a warm place out of draft, until next morning, then tighten the covers and remove to a cold place. In using tin cans this care need not be taken, they can simply be lifted from the boiling kettle, sealed at once and left until the next morning, then stand them upside down to see that they are tight. This fruit will keep unsealed, but will mold and may not be as wholesome as that that is air tight.

At any time glace fruit may be made from these by rolling them in dry sugar and placing them in a bed of sugar in a warm, not hot oven, for a short time.—M. E. S.

Sorghum Seed.

Will you tell me the value of Sorghum seed for poultry? Is it fat-producing or an egg food and how would it do for turkeys?—C. B. C., Poway.

Sorghum seed, Broom corn seed and Egyptian corn have almost the same nutritive value. They can be fed to both chickens and turkeys with the same satisfactory results. One year when on the farm I had several tons of Broom corn seed, which was left where the threshers worked and the fowls had free access to it and the green growing wheat they got through the moult early and laid all winter eggs galore, I never saw better laying and the turkeys did well on it.

Professor Jaffa in his most valuable bulletin (Farmer's bulletin 164) on poultry feeding gives as the nutritive value of broom corn and of sorghum seed both the same 1: 8.4 of Egyptian corn 1: 8.6. Sorghum seed is more fattening than wheat and less fattening than corn. If your fowls are on free range and have plenty of green food and animal food or milk, Sorghum seed will be an excellent food for them.

You should write to the Director Agricultural Experiment Station, University of California, Berkeley, and ask him to send you "Bulletin 164 on Poultry Feeding" then you can see just the right way to balance your rations.—Mrs. A. B.

Care of Turkeys.

I would like to ask a few questions about turkeys. You mentioned raising them in a brooder.

(1.) How warm should one have the brooder when the poults are first put in?

(2.) At the end of the first week what should the temperature be lowered to?

(3.) Our brooders are Cyphers, where should we hang the thermometers?

(4.) Is alfalfa meal necessary, or of any benefit, to little poults or to little chicks, if they have all the green barley they will eat cut fine?—A Subscriber.

The heat under the hover should be about 95. The reason I say "about" is, that on a very warm sunny day it might be a little lower, but should the outside temperature be cold or the weather damp and gloomy, it must be up to 95. for best results.

(2.) About 85., depending somewhat on the outside air and weather. Gradually lower the temperature till you get it to 70. or to 75. according to the weather.

(3.) There is a hole in the hover of the Cyphers' brooder for the thermometer to hang; keep your thermometer hanging there in its proper place.

(4.) No! Little turkeys require the succulent green, not the dried hay ground up. Give them lettuce chopped up at first with every meal; then either lettuce, dandelion leaves, onion tops chopped fine or cabbage; the tender leaves of beets, any green vegetables that you would eat yourself will do and also the green barley as long as it is succulent and tender, barley soon gets tough and hard and then is not suitable for little turkeys.—Mrs. A. B.

Sick Turkeys.

My turkeys are droopy; their droppings are as yellow as the yolk of an egg. They seem to drink an unusual amount of water, but won't eat anything. Have plenty of green feed, shells, grit, etc. Can you give me any light on the subject, as to cause, and treatment, and if there is any possibility of cure?—A Subscriber.

The symptoms you describe are very much like those of cholera. Send a

20% More Profit in Poultry Raising

is a conserative estimate of the results from using Glendale Incubators and Brooders.

Take your pencil and figure it out. The Glendales not only hatch more eggs but raise the chicks—develop them into healthy, lusty chicks.

Any incubator will occasionally make a good record but the Glendale is superior because it always makes a good record.

Glendale Incubators and Brooders

are so simple that it is practically impossible for any one to make a mistake. They are built especially to withstand California climate. Large poultry raisers who make critical tests of every incubator and brooder, have stated that they would buy the Glendales if the price were 50 per cent. higher. Results are what count. Glendale Incubators and Brooders cost less than any other standard machines on the market.

The 120-egg size, $22; 240-egg size, $32; 360-egg size, $42; 500-egg size, $52.

We want you to attend a free demonstration now being conducted. If this is not convenient, write for catalogue.

R. F. D. 1 F. W. Tutin, Riverside Cal.

postal to the Director of the Experiment Station, University of California, Berkeley, for the bulletin on "Fowl Cholera." Meanwhile I would advise your moving all those that are well onto fresh ground, keeping the sick by themselves; give them each one grain of calomel at night, followed by a 2-grain pill of quinine the following day, repeat the dose if necessary, and into the water of all of them (sick and well) put one tablet of corrosive sublimate to one quart of water. This is a dilution of 1 to 2000 parts of water. This will kill the germs in the water. Corrosive sublimate is very poisonous, so be careful not to leave the tablets where children or anyone can get them; also do not use a stronger solution. The bodies of fowls that die of cholera should be cremated as the disease is very infectious.—Mrs. A. B.

Neglected Oranges.

I have a small orange grove of seedlings that are probably 12 to 15 years old, and which, for the last three or four years have been neglected and the oranges are very small. Please tell me what to do with them in order to bring them back. I have heard there was a good mineral fertilizer. Can they be successfully budded or grafted with navels?—A. C. W., Stockton.

Use plenty of stable manure with about one pound of sulphate of potash and four pounds of acidulated bone per tree twice a year.

Make one application now and one in the first part of July. In the fall, about October first, plant about 40 pounds of vetch per acre. Get this to growing as soon as you can, irrigating before planting and leave the grove furrowed out for irrigating again and let it remain so till the late winter plowing when you can repeat the commercial fertilizers, spreading it on top of the green stuff and plow all under at the same time.

Your trees can readily be transformed to Washington navels by following the directions given in the Cultivator of March 7th, 1907.

Spray and Dip.

Last summer I found a receipt in one of your articles for spraying henhouses, I used it to good advantage, but have misplaced the receipt, and cannot remember the mixture exactly. It was composed of coal oil, carbolic acid and soap, with a certain proportion of water; if you will kindly send it to me I will appreciate it.—C. W.

I gladly send you the receipt for it is excellent. I have used it for ten years or more; it will kill fleas, lice, mites or any insect pests in the heneries. It will also thoroughly disinfect the premises from infectious diseases and if used as a dip for hens in warm, sunny weather will rid them of lice and will assist the moult.

Dissolve one pound of hard soap (or soap powder) in one gallon of boiling water, remove from the fire and add immediately one gallon of kerosene and one pint of crude carbolic acid. Churn or agitate violently for twenty minutes or until you want to use it. If the oil and water separate on standing, then the soap was not caustic enough. Add to this ten gallons of water.

I keep the stock solution on hand; dip out a quart and add to it ten quarts of water and use it for spraying the houses once every three weeks in summer and every month in winter. Putting it on hot in summer and slopping it well into dark and dusty corners will kill fleas, which are exceedingly troublesome on sandy soils in this part of the country.—Mrs. A. B.

Sick Turkey.

Mrs. W. A. has a fine turkey gobbler that is suffering with running of the bowels, don't eat and is quite droopy. Will you kindly suggest some remedy; it is a valuable turkey.

Give the turkey a liver pill, such as you use in your family or a grain of calomel. Follow this with a grain of quinine given every night for four days. Feed rice boiled in milk adding to every pint one tablespoonful of ground cinnamon. If Mrs. W. A. had written direct to the writer she would have had an immediate reply. Quick treatment is needed with turkeys.—Mrs. A. B.

Standard Mowers For You

"Sure Hatch" A Wonderful Hatcher

You can almost count your chickens before they hatch, if you use a "Sure Hatch." Our Show Window Hatch was no record breaker, but hatched ***94 strong chicks*** from ***102 fertile eggs.*** R. H. Criffield, St. David, Ariz., reports ***84 strong chicks*** from ***88 eggs,*** and all doing nicely with a Sure Hatch Brooder. We have many other reports equally as good from the 1907 ***"Sure Hatch."*** The "Sure Hatch" Brooders will raise from 85 to 100 per cent. of all strong chicks put into them. No cold corners to produce crowding, but an even temperature over the entire brooder, with plenty fresh air to produce strong, healthy chicks. Don't buy a brooder until you have seen the "Sure Hatch." You want the brooder that will raise the most chicks. See the "Sure Hatch" incubators and brooders in operation at 809 So. Main St. Send for Free Catalogue No. 25.

The Vegetable Garden

By ERNEST BRAUNTON

VEGETABLE SEED.

GOOD crops are grown from good seed, and the gardener cannot run the risk of failure by using doubtful seed. There are but few vegetable seed that the gardener can afford to grow for his own use. In fact but few gardeners are versed in the art of the growth and selection of seed.

The reliable and up-to-date seedsmen are, as a rule, as careful in the selection and breeding of the different varieties of cultivated plants as are the breeders of live stock. Considerable knowledge and skill are necessary for the successful improvement and perpetuation of the better qualities of a variety, and the seedsmen employ experts to grow many of their seed, and constantly endeavor to evolve something better by selection and cross-breeding.

Within the past few years varieties of very near all of our common vegetables and farm crops have been improved or introduced that possess qualities superior to the varieties considered best a few years ago. The average gardener or farmer does not fully understand either the principle or the practice of growing good seed, hence much of the common complaint of seed "running out." Experience has taught that certain seed grown in certain localities produce well, and vice versa. Some seed produce better when grown in the latitude or altitude in which they are to be planted, while others are better grown further north or further south. Watermelon, muskmelon, cucumber, squash, corn, okra, Lima bean, pepper, eggplant and tomato seed should be grown under climatic conditions as nearly similar as possible to the condition prevailing where the seeds are to be planted.

On the other hand cabbage, cauliflower, beet, carrot, turnip, parsnip, bean, pea and lettuce produce more satisfactory results when the seed are grown further north, while French grown radish seed are considered superior to those grown elsewhere. Reliable seedsmen now recognize these and other important facts, and grow their seed and fill their orders accordingly. Practically all of our cultivated plants have been improved or bred up to form and substance and other desirable qualities which are superior to those possessed originally by the plants, and they have a natural tendency to revert to their original character, hence the greater care necessary for the continuation of these artificial or evolved characteristics, and for their improvement.

Again, the cross-fertilization or "mixing" of plants will take place at considerable distance through the influence of insects and winds, and great care is necessary in planting related varieties to have them sufficiently removed from each other to prevent this crossing, or hybridization, as the case may be. Many seedsmen now take great pride in their "thoroughbred" or "pedigree" seed. These pedigree seed are about as important to the gardener as the pedigree cow to the dairyman.

PLEASURES OF FRUIT GARDENS.

The people of this country are notably a fruit-loving and fruit-eating people. Notwithstanding this, however, fruit culture has grown to be classed among the specialties, and few persons who consume fruit are actual growers.

The possibilities in fruit culture upon restricted areas have been very generally overlooked, with the result that many persons who own a city lot, a suburban home, or even a farm, now look upon fruit as a luxury. This can all be changed, and much of the land which is now practically waste and entirely unremunerative can be made to produce fruits in sufficient quantity to give them a regular place upon the family bill of fare and at the same time add greatly to the attractiveness of the table and healthfulness of the diet.

HOME FRUIT GARDEN.

The home garden is always the forerunner of commercial development, and even in those localities where climatic and soil conditions are adverse to such industries in a commercial way the home fruit garden of the enthusiastic amateur is certain to be found.

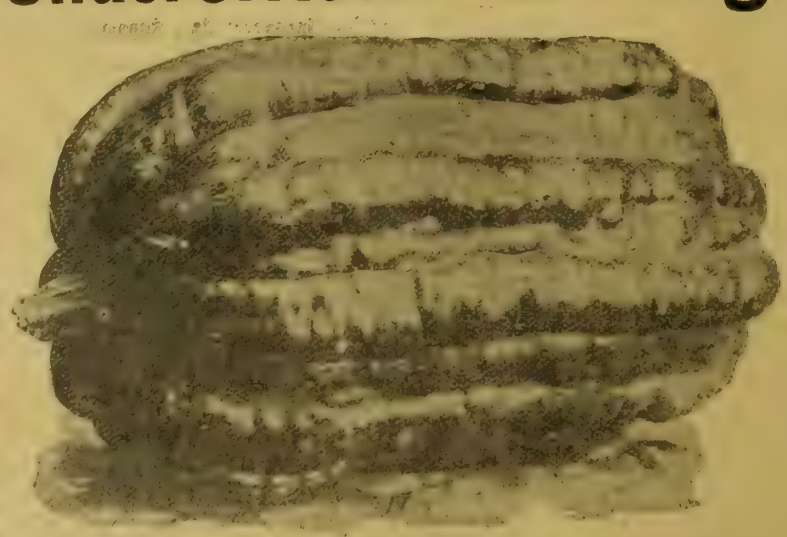
All the success attained today by the fruit interests of the United States has grown out of the persevering efforts of a few men whose home fruit gardens served not only as testing stations for determining the fitness of given sorts for new and untried localities, but they were the propagating grounds from which sorts of the highest quality and greatest commercial value originated.

DOWNY MILDEW.

Downy mildew, the most destructive of all cucurbit diseases, is especially injurious to cucumbers, but also attacks melons, squashes, pumpkins, gourds and other related vines.

Appearance.—The first indication of downy mildew in the field is a yellowing of the older leaves in the center of the plant. Faintly defined angular spots bordered by the veins will then be detected.

Chas. C. Navlet Co's Bug Proof Squash



CHAS. C. NAVLET CO.'S BUG PROOF SQUASH—THE SQUASH OF THE CENTURY

THIS is unquestionably the grandest Squash on Earth. It grows strongly and rapidly. It defies the attacks of bugs. It produces colossal crops. It keeps in perfect condition for a whole year. The fruits—of oblong shape—have very rough—and very hard shells, and weigh about 40 pounds each on an average. The flesh is a rich yellow in color, very thick, fine grained, sweet, dry and of surpassing flavor either roasted, boiled, steamed, baked or in pies. It is also one of the finest Squashes for feeding to the stock. We are sure that those who planted Bug Proof Squash this season, whether for family use or market, will appreciate its unequalled merits as thoroughly as we do. Per packet 10 cents—quarter pound 35 cents, half pound 60 cents, pound $1.00 Post paid

The Ornamental Garden

By ERNEST BRAUNTON

ROSES.

THERE is no flowering shrub or plant so generally satisfactory as the Rose.

As single specimens scattered here and there over the grounds, they form graceful shrubs.

Planted close together along walks or borders, they can be trained into exceptionally beautiful flowering hedges.

Allowed to run riot over stumps, rocks, old fences, they soon cover and transform unsightly objects into attractive bits of scenery.

Massed together, they can be used for figured plots and greatly enhance the effect of well-kept grounds, or, placed on edges of wild stretches of woodland, they form a striking foreground.

As veranda vines, the climbers form a mass of green and pink, or red, or yellow, or white, or a combination of colors, as desired—an effect that can hardly be approached with other climbers.

Planted in any form, they furnish a wealth of flowers at all seasons, if a judicious selection of varieties is made. And, for cut-flowers, Roses are universal favorites. How much more cheerful a house seems for having here and there, on tables, mantles, bureaus, vases of beautiful Rose-buds! How easy to decorate the parlor or garnish the dining-table for an evening entertainment if one has plenty of Roses!

It goes without saying that no one Rose is adapted to all the different purposes above named. It is not necessary that it should be. There are many different classes of Roses, and amongst the hundreds of varieties can be found those adapted to any purpose wanted.

BOTANY OF THE HOP.

There is but one botanical species of the hop (Humulus lupulus), but numerous varieties have been developed by cultivation. The hop is a climbing vine with harsh foliage and rough stems which twine from left to right with the sun. In a wild state the vines clamber up the stems of shrubs or over walls and fences. They frequently reach a length of 25 feet or more.

The hop is a perennial plant, the vines dying in autumn, and new ones springing up from the root in spring. It is dioesious, the male and female flowers occuring on different plants. Hops can be propagated either from seed or roots; the latter are almost universally employed in practical culture; the former are useful as a means of developing new varieties. In some parts of Europe, notably the best hop-growing regions of Bohemia, seedless hops are raised.

FERTILIZERS.

With shade trees and shrubs growth is often the prime object to be attained, and a fertilizer containing a large percentage of ammonia and a small percentage of potash is advisable. Five to six per cent. of ammonia, 7 to 9 per cent. of phosphoric acid and 3 to 4 per cent. of potash is about right.

With roses the object is different, for the flowers, as well as growth, are wanted, and flowers are to a rose-bush what fruit is to a fruit tree. Consequently, a fertilizer containing a good percentage of potash is advisable. About 8 to 10 per cent. of potash, 7 to 9 per cent of phosphoric acid and 3 to 4 per cent. of ammonia will answer the purpose admirably.

GROWING EUCALYPTS.

Noting some questions your subscribers have asked regarding the growing of Eucalypts, I think I will give you my experience, although it will not apply to all sections of the state. My present plantings are close to nine hundred thousand trees, none over three years old, and were all grown by me from native and imported seed.

I do not irrigate, and no water is nearer than thirty feet from surface. The land is rolling mesa, from four to six hundred feet above sea level, sandy and adobe, but no alkali. My first plantings were Tereticornis (seed obtained from Hon. Ellwood Cooper) rostrata, diversicolor, corymbosa, corynocalyx (seed collected near Los Angeles city).

All have done well, except the diversicolor and corymbosa. Shall not plant these two species again, although I would do so if I had damp land, or could irrigate for two years. My next plantings were E. tereticornis, Linaris Nobis, a species that grows unusually tall and straight, only a few to be found in California. I only know of nine trees and from these I got my seed. E. gomphocephiael (Ellwood Cooper seed), E. Sieberiana, all have grown splendidly and are twenty to thirty feet in height.

My next planting has been E. tereticornis (Ellwood Cooper seed), E. corynocalyx, E. rostrata, E. Bosistoiana, E. Maideni, and E. Dawsoni. The last named are new species, never before grown in California, and from the way they take to their new home, I shall plant 100,000 each this coming year. I shall grow altogether 600,000 trees for next planting, and I shall not stop until I have 4000 acres planted, using for that purpose four million seedling trees. I find that with economy it costs no more to have an acre of Eucalyptus up to two years of age than a crop of corn, and after that time they take care of themselves.

I plant my seed in July and commence planting in field about December 1st, and continue right through to March 15th. If I were fixed for irrigating, I would plant every month in the year. As you see from my letter, I plant no E. globulus (blue gum). I am growing the best species that will produce timber for technical uses.

I have made a study of Eucalypts, and believe I can be of use to your subscribers who need information as to the species suited to their localities on the coast. More in future letters.—Yours truly, Dwight Whiting.

The Produce Markets

Los Angeles Markets

LOS ANGELES, March 27, 1907.

The butter supply since Monday morning has been much heavier owing to the arrival of a large shipment by boat from the north. The receipts posted on the board of the Los Angeles Produce Exchange this morning were 45,644 pounds, nearly twice the amount needed to meet the consumption for one day, but this was not at all excessive at this time, owing to the irregularity with which the supply has been coming in. Dealers easily found a place for all the surplus of one shipment in filling back orders.

Valley Creamery	67½
Coast, fy,	60
Cooking	20

Cheese

The cheese market is firm on account of small receipts and owing to the firm condition of the cheese market in the East. Prices of cheese today are several cents higher than at this time a year ago.

Vegetables

The supply of fresh vegetables was abundant this morning, especially of bunch goods, and demand was slow on account of the weather. Dealers will carry over a large amount of goods until tomorrow.

Asparagus, lb.	12½
Beets, per doz	40@60
Bell Peppers, Green, lb	5
Cabbage, sack	1.65
Chili Peppers, Green	30
Chili, Dried, per lb.	13½
Cucumbers, per doz	1.50@1.75
Cauliflower, per crate	2.25
Carrots, per doz.	40@50
Celery, per doz.	40
Egg Plant, per lb	15
Garlic per lb	6
Green Onions, doz. bunches	25@30
Lettuce, per crate	1.00@1.25
New potatoes, per lb.	5@6
Lima Beans, per lb	7@8
Onions, Aust. Brown, sk	135@1.50
Onions Y. Danvers	1.35@1.50
Parsnips, per doz	35@50
Rhubarb, per lb.	6@8
Radishes, per doz	15@20
String Beans, per lb	8@12
Sugar peas, per lb.	6@8
Turnips. doz. bunches	40@50
Tomatoes, per box	75@1.25
Wax Beans, per lb	16@18

Citrus Fruits

Lemons	2.00
Valencias	1.50@2.00
Navels	1.25@1.50
Grapefruit Seedless	2.00@2.50
Grapefruit seedlinggs	1.25@1.50

Fresh Fruits

Strawberries are arriving more freely and prices are lower, particularly for the best grades that arrive. Fancy stock did not bring over 10c a box this morning and the bulk of the supply sold from 8 to 9 cents.

Apples, Bellefluer, per box	1.50
Apples, Ben Davis	1.50
Strawberries	8@10

Dried Fruits

Evap. Apples, fancy, per lb	9
Apricots	18
Peaches	12
Pears	12@13
Prunes, fy.	5@8

Beans, Dried

Limas, No. 1, per cwt	4.75
Pink No. 1	2.65@2.75
Lady Washington	2.75@3.00
Small White	3.25@3.40
Black Eyes	5.50@6.00
Garvanzas	5.50@6.00
Lentils	12@15

Honey

The prices we give are those at which the jobber sells to the grocer in small lots. The producer should take from this one cent a pound commission and freight to Los Angeles, and there will remain the net returns to him.

Extracted, w. w. 60-lb. cans, lb.	7
Light Amber	6½@7
Comb, water white, 1-lb. fms	16
Light Amber	11

Nuts

Almonds, new, per lb	19@20
Peanuts, Virginia	7
Peanuts, California	6½
Walnuts, No. 1, S. S.	14@15

Hay

Barley, No. 1	14.50 @16.00
Barley, No 2	11.00@12.00
Alfalfa, Local, per ton	14.00@16.00
Plain Oat Hay, No. 1	17.00@19.00
Plain Oat Hay No. 2.	9.00@15.00
Wheat No. 1	14.00@16.00

Grain

Purchasing prices f. o. b., Los Angeles are:

Wheat, new, per cwt...	1.50
Barley (to producer)	1.00@1.05
Rolled Barley	1.35
Corn, per cwt.	1.40
Cracked Corn	1.45
Feed Corn Meal	1.50
Shorts	1.35
Bran	1.20
Oil Cake Meal	2.50
Cocoanut Meal	1.40

San Francisco Markets

SAN FRANCISCO, March 26, 1907.

Butter.

The receipts of butter, cheese and eggs are keeping up quite well from nearby sections by rail and boats. Eggs especially are coming in freely and extras today declined 1 cent per dozen. Butter advanced ½c per lb. for seconds and ½c for thirds. Fancy new cheese was ½c per lb. higher. All positions were firm.

California, ex. per lb.	33
California, firsts	31

Vegetables

Asparagus	5@7
Cucumbers, per doz.	1.00@1.25
Chili Peppers, Green lb	15@25
Egg plant per box	3.00@3.50
Green Peas, per lb	6@12
Squash, crates.	65@90
Onions, Red, per sack	75@1.00
Onions, Yellow	75@1.00
Peppers, Green Bell	25
Rhubarb, per box	1.00@1.50
Squash, crate	65@85
String beans	15@17
Tomatoes, Mexican	1.75@2.00
Wax Beans	15@17

Citrus Fruits

Oranges were in good demand and moving freely today. Only very choice were bringing over $2.75 per box.

Lemons	75@2.50
Navels	1.00@2.00
Seedlings	1.50
Grapefruit, seedlings	1.00@1.50
Grapefruit, seedless	2.00@3.00
Limes	3.50@4.00

Fresh Fruits

Strawberries are now due from Los Angeles and expected tomorrow. Eleven carloads of delayed Central American bananas arrived, divided between here and Oakland. They showed the effect of being long on the way, and much will have to go as peddlers' stock.

Apples, per box	1.00@2.00

Dried Fruits

Apples (evap.)	6@8½
Apricots, per lb	16@20
Figs, white	4@5
Prunes	3@4½
Peaches	10@12½
Raisins, seeded (1906)	3½@10
Thompson, unbleached	7½
Thompson, bleached	9@11

Beans and Seeds

The demand for Beans continues fairly steady, with the preference still in favor of the colored varieties.

Limas, No. 1	4.15@4.25
Pink	2.40@2.60
Large White	2.40@2.55
Small White	2.95@3.05
Black Eyes	5.00
Red Kidneys	3.75
Bayo	2.90@3.00

Hops

Desirable grades of California, 1906 crop, future delivery, 10@12 cents per lb, with occasional sales at 12½ cents.

Nuts

Almonds new	14@18

Chicks Just Hatched

We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States

MAXWELL, MAY 27, 1906.

CALIFORNIA INCUBATOR CO.,
Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.

More about Chick Food.

We hear so much talk about feeding poultry, such a variety of opinions, that after listening to all the talk, one begins to wonder how our ancestors ever succeeded in raising any poultry at all; but when referring to past history we find that they did raise poultry, and that their minister was sure of a yellow-legged young rooster for dinner. We also read that they only raised a very small proportion of the chicks that were hatched, which accounts for the fact that they did not have the proper food to bring their young chicks up to and past the age at which so many die.

We have been experimenting with Chick Foods of different makes that are being sold in this market, and our investigation has caused us to study the elements that go to make up the various Chick Foods, and there is one Chick Food we have found that meets all the requirements necessary to produce strong, healthy chicks;—the Excelsior Chick Food,—which is a clean, honest product, manufactured by the Excelsior Mills, 242 Central avenue.

In order to derive the best results, we should advise feeding your hens, once every day, Excelsior Egg Food, which will insure fertile eggs;—then feed your baby chicks on Excelsior Chick Food. We can safely say that you will make no mistake.—Adv.

IT'S PENNY WISE.

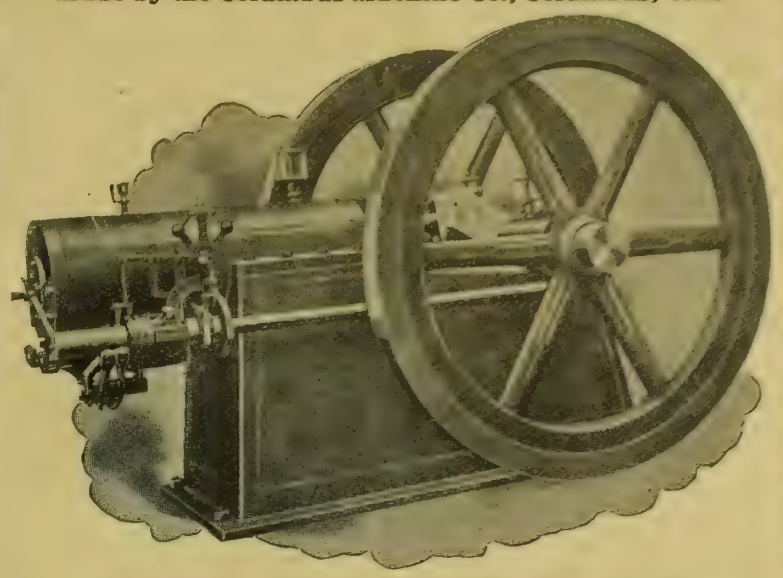
There is a Reason why you should buy
Columbus Engines
Made by the Columbus Machine Co., Columbus, Ohio



Simplicity—Highest Efficiency—Economical
Highest Grade of Material—Best of Workmanship

They have been in the field over fourteen years.
Their output is one of the largest in the United States.
What does this mean? It means that the present standard they are maintaining on Columbus Engines is the result of fourteen years labor of experienced mechanics with one of the best equipped plants in the United States behind them, to produce an engine which is simplicity in itself.
Free from all complicated and trappy devices. It don't take an expert mechanic to see the simplicity and good points on the Columbus Engine over other makes.
It don't take an experienced mechanic to operate it. We carry complete stock at all times. Come in and let us show you.
Estimates given on complete pumping plants.
Correspondence Solicited.

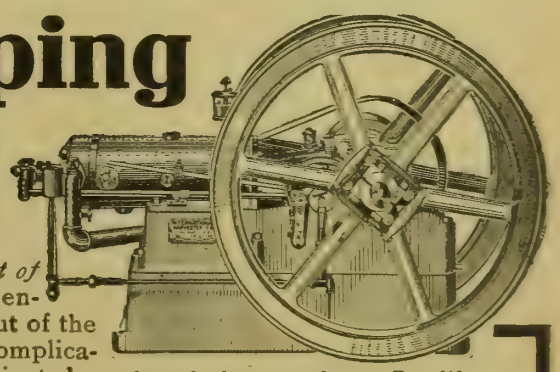
BURN AIR AND SAVE FUEL
You can do it with the
HAGUE IMPROVED DOMESTIC OIL BURNER.
It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to
Hague Domestic Oil Burner Co.,
214 Winston St., Los Angeles, Cal.

When writing advertisers, mention Cultivator.

Irrigation Pumping
is done easily and economically with an
I. H. C. Gasoline Engine



WHETHER you are pumping from deep wells, shallow wells, reservoirs, canals, or running streams, an I. H. C. gasoline engine is the one best power.

It is the best for a number of reasons.

In the first place, it is *easily operated.* You don't need an engineer to look after it—in fact it requires practically no attention whatever—it will run for hours at a time, safely and regularly, and when it does needattention, your small boy or girl can look after it as well as you can.

Next it will *not get out of order.* I. H. C. gasoline engines are made throughout of the best materials, and all complicated parts have been eliminated.

And again, it is economical.

Ordinary stove gasoline is the fuel it uses, and it gets all the power out of it and wastes no fuel. And gasoline is something you can always have ready. Buy it by the barrel, and it is easy to keep a supply on hand.

And there are many other features which we can't go on to explain here—durability, safety, convenience, etc. Investigate them before you buy. It will pay you to know all about them.

I. H. C. gasoline engines are made in various styles,—Vertical and Horizontal, Stationary and Portable, and in sizes ranging from 2 to 20-horse power. When not in use for pumping they furnish excellent power for sawing wood, cleaning grain, grinding feed, shredding fodder, separating cream, etc.

A LITTLE MAN.

A little man dwelt in a little town
A little over twenty years ago;
He gained a little portion of renown
Within the little crowd he used to know.
He wed a little maid when twenty-one,
And later on they had a little son.

This little man had little to regret.
He had but little patience with the weak;
When others fell his eyes were never wet,
With sinners he had little time to speak;
Instead he went to church a little late
And dropped a little nickel in the plate.

He drank a little coffee now and then
But little stronger liquor passed his lips;
He mingled little with Bohemian men;
Life's wine he drank in stringy little sips.
When stragglers came to him for food or bed,
With little pain he shook his little head.

He made a little fortune rapidly
By grinding labor out of little arms,
And by foreclosing a variety
Of little mortgages on little farms.
He died—and, 'neath the little willow bough,
A little worm is working on him now.

—Milwaukee Sentinel.

THE VIAL OF POISON.

CROMARTIE has just published another successful book, and five of us were gathered in his flat, drinking his wine and his health, and saying nice things to him. He lived in Clement's Inn. Everything about him was comfortable, and only I and Kelthorpe—friends of his early days—knew of the fights and struggles he had had to wrench this comfort from the grudging fist of life. And he had paid for it; his face was old and wrinkled, and his hair was gray. I think it was something that Grier said about the necessity of having faith in one's self, if one would be successful, that made Cromartie talk. "You are quite right, Grier," he said, "without faith one is bound to fail. Not faith in one's self, so much as faitn in anything; faith in God, in a woman, or in your work."

At this moment Mrs. Cromartie entered the room, and we rose to our feet. She smiled at us, and went to her husband to kiss his forehead for "Good night." I could not help noticing how Cromartie's fingers closed round her arm.

When Mrs. Cromartie had left the room there was a span of silence, and then Grier said, wistfully: "It must be splendid to have faith. To feel that one can never fail."

"That's the proper spirit," remarked Cromartie, "I'm glad you have that."

"Oh! but I haven't, Mr. Cromartie," cried Grier, with almost a sob. "That's what I haven't. I m always fearful of failure. When you were my age," he asked, "were you like that also?"

We wondered what the reply would be from Cromartie, now that he was at the summit of success.

"Yes," replied Cromartie, shortly. "I was worse. For I was on the very brink of failure. But I won through—simply through faith, though my faith was in a vial of poison.

"I think the story may interest you men," he said, and going to a cabinet, he took from it a small bottle of blue-fluted glass. This he set on the table.

"In this one thing," he began, "you people will be more privileged than my wife. For I would not tell this story to her, though she is one of the characters in the plot. It happened in those years when I dropped away from you and Kelthorpe, and my story is to show you what faith can do.

"I was a clerk in a lawyer's office, and between time I used to write. Everything came back to me with brutal regularity. So I went through the usual stages of advancement; first a story in a local paper; then a poem in a magazine which never paid for poems; then a good story in a paper which died, then stagnation and an impasse! I felt that I had come to the end of things. Twenty-five, mark you, and my whole brain turned with thoughts of gray despair. I had thrown up my job in the law once for an ill-paid position on a trade paper. I felt low and mean, and jealous of every name I saw in print. Twenty-five, again! I had written a long novel, purposely bad, because I wanted money only I made it too bad. (I've got it somewhere in my desk). I felt I should never do anything worth doing; and grew morbid and depressed. Of course I began to drink unwisely.

"Now, I met a lady who is today my wife. She was a breadwinner herself—there's no shame in it, only glory, to say that she was a typist. We first met when I called to see her to ask her to allow me to defer payment for a story she had typed for me. It occurred to me that I was as soiled and sordid as she was pure and splendid.

"The day I came away from her I vowed great things to myself, but when night came I went to bed dulled with drink and dreamed of shattered promises crashing about my ears like falling houses.

'I must tell you that I hid my failures from her. I pretended that I was doing it for her sake. I was now 27, with nothing accomplished. And it was on my 27th birthday that she agreed to become my wife.

" 'Now,' said I to myself, 'I will turn over a new leaf. I will work my best, and I will drink no more.'

"Oh, those were old promises, and I always knew how to cheat myself. I didn't write, and I did drink."

"Go on," said Grier, in a strained whisper.

"There came a morning," continued Cromartie, "when I looked at myself in the mirror and saw that it must stop.

"Conceive me, then, going to a man whom I knew—a relation of mine—and telling him my story. 'I have,' said I, 'a great work to accomplish now. I can write, I know, and I pledge myself, within a year, to write a good book. I won't say it will be a great book, but it will be good; my best.'

" 'Well?" he asked kindly, for I looked very pale and weak and distressed.

" 'Well,' I replied, 'I have an idea, and I want you to help me. I must write this book, you see. I simply must work and give up idling. I want something to make me do it. Love has made me want to do it.' I hesitated, and he asked me again what I wanted.

" 'Give me some poison—laudanum, or morphia, or cyanide of potassium, or anything that kills cleanly and swiftly. Give me this, I say, and I will

take it with me. I swear to myself, with you as witness, that if I fail I will take this poison. But I will not fail again, because I want to live.'

"'I can't do it,' said the doctor. 'How do I know that you won't go and drink it at once?'

"I made him understand that it was the idea of having to die at once, if I failed, which would keep me from failing. And he gave me this little bottle, this vial——"

"Ugh," said Grier; "a beastly smell of almonds."

"Get on with the story," said one of the others.

"Well, I went away feeling that I had taken upon myself some great responsibility. The responsibility of my life. I determined that this promise I had made I would keep. I need not bore you with the monotonous repetition of day after day. It was one long fight against myself. The words grew upon my paper; every sentence was won from my pen by self-sacrifice. I isolated myself from my love, and only saw her one or twice a month.

"As the months passed by I saw that what I had written was good. It was of tears and hope, with laughter that was sorrowful. And so I gradually came to have faith in myself, and through that faith to have faith in my love—faith in God and faith in life. One happy day my book was finished. You know the book—'The Test.' It didn't bring me money, but it brought me good word and the beginning of all this." He waved his arm around the room.

"When all was finished I took my vial of poison back to the doctor and gave it to him. 'I have no further use for it,' I said. 'I have finished my task, and I have kept my promise. I am strong enough now without it.'"

"He laughed, and, uncorking the vial, drank from it. I gave a cry of horror and sprang toward him.

"'What's the matter?' he said looking at me innocently. 'You didn't suppose I'd have risked giving you poison? This is only water.'"

We all laughed foolishly.

"That's all," said Cromartie.

"Pass me that bottle," said Grier, huskily. He smelled it again and blushed. "I'll swear it smelt of almonds the first time."

"I smelt of almonds for a year," murmured Cromartie.

"Imagination!" said some one.

"And a moral!" added I.—A Curlander.

FRENCH CABBAGE.

Slice the quantity of cabbage needed and steam in a saucepan for a few moments with a little water and two tablespoonfuls of butter. As soon as the cabbage can be pierced with a steel fork, cover with a dressing made from one egg, one-fourth spoon salt, pepper and one-half cup cream and two tablespoons of vinegar. Steam for a few seconds and serve. Some add a little flour and quite often olive oil is used in place of butter.

HOME REMEDIES.

Inflamed eyes may be relieved by binding over them for a few minutes the scooped-out inside of a fresh potato.

Headache almost always will yield to the application of hot water to the feet and back of the neck at the same time.

If sweet oil is applied to the skin immediately after a blow or bruise it will keep the skin from turning blue or black.

COOKING WINTER BEETS.

The winter beet is tough and not easily cooked. They should be thoroughly scrubbed and the first boiling water drained off to remove the earthy flavor. When tender throw into cold water to slip off the skins, cut them in even slices and serve with vinegar, lemon juice, pepper and salt.

CORNMEAL PUFFS.

Take one cup of hot milk, one tablespoon of melted butter and a pinch of salt; mix well together and add half a cup of cornmeal. Let the mixture cool while you beat two eggs; add a fourth of a cup of sugar to the eggs, and a fourth of a cup flour in which two teaspoons of baking powder are mixed. Stir this all together thoroughly and then put it with the milk and cornmeal. When beaten smooth, pour into hot muffin tins and bake about twenty minutes.

LUNCHEONS WITHOUT MEAT.

Oysters and celery—Cut up and stew two cups of celery until it is transparent and the water is all absorbed; season with salt and pepper. Simmer a pint of oysters in their own juice until the edges curl; season these also and add to the celery. Thicken half a cup of rich milk and pour over all, and serve on rounds of buttered toast.

Creamed finnan haddie—Soften the fish by pouring boiling water over it. Make a large cup of rich, white sauce and after squeezing out all he water from the fish put it in and let it come to the boiling point; serve on buttered toast or as it is.—Harper's Bazar.

MARCH PUDDING.

One cup dried apples, one cup of syrup (made of sugar), one and one-fourth cup flour, one-fourth cup butter, one egg, one teaspoonful each of soda and cinnamon, one-half teaspoon cloves.

Wash and soak apples over night in just enough water to cover. Chop fine, add syrup, hot; then water in which they were soaked, also spices.

Mix egg, butter and flour together, stir soda with apples and syrup, then mix all together and bake in a moderately hot oven.

Serve with cream or with sauce made of one-half cup of butter, one cup sugar, beaten smooth, and flavored with nutmeg.

PUMPKIN PIE.

Stew pumpkin until well done. Mash through colander. To one teacupful add, while warm, granulated sugar to taste, one large tablespoonful of butter, well-beaten yolks of two eggs, and rich cream sufficient to make one pie. Last, stir in the well-beaten whites. Flavor with vanilla or lemon extract.

FIVE MINUTE CAKE.

Take a large cup and fill one-fourth full of melted butter, and into this drop two eggs; then fill the cup up with milk. Sift together one cup of sugar, one cup of flour, a rounding teaspoonful of baking powder. Into this turn the butter, eggs and milk, and beat very hard. Flavor with vanilla. This is good for either a loaf or layer cake.

FRENCH FRIED POTATOES.

Cut in any shape preferred; they should be laid in cold water an hour or more, then dried on a towel before cooking. Slice the potatoes in eights the length of the vegetable and drop them into boiling fat. The pieces will float when done, yet should remain until they are a golden brown. Place in a dish and give them a dash of salt and peper.

Stock Raising in California

Continued from First Page

a place of value for fresh cows, it then acts as a laxative, and should be used for a week or two for fresh cows.

Cheap Feeding.

I further think that a dairy cow can be fed cheaper in the great alfalfa regions of the state than in any other part of the United States that depend on home-grown food. There may be places where by-products help the dairy man out, but usually, the manufacturer boasts that he runs his plant on the sale of the by-products, this does not tend to make them cheap.

Improved machinery in the hay field is needed, everywhere, strong, heavy, well-built machinery that will enable fewer men to do the work. The old main strength and awkardness squad of workers must give way to men that have brains to operate machinery.

Alfalfa Growing.

Alfalfa is a greatly abused crop, it will grow and produce some feed under any kind of treatment. Yet, there is as much difference between the palatability of well-grown alfalfa and that poorly grown, as there is between the crisp fresh-grown radish of springtime, and the slowly-grown one, hard and of woody fiber, grown in the heat of summer.

Now I do not know that the two radishes would show any difference in the chemical analysis, except in the amount of water contained. Yet, the difference in the way the family will eat them shows that the food value of one is greater than the other.

Alfalfa hay is the same; the cows will lick the mangers to secure every scrap of well-cured leafy alfalfa hay, while the coarse woody stuff they nose half out of their mangers and leave it. Of course only the feed consumed makes milk, not the waste. Watch the stock on the ranch, see that they eat with keenness, for "digestion ever waits on appetite."

Manuring.

Every fall the alfalfa field needs top dressing with stable manure, to which 200 to 400 pounds of land plaster has been added, for every acre. The manure spreaders are excellent for this purpose and pay for themselves quickly in the labor saved.

If the stand is an old one it will pay to disc the field, and harrow fresh seed into the thin places, before spreading on the manure. I prefer to do this seeding in the fall of the year; some years the young alfalfa may be frost killed, when it will have to be reseeded in the spring. But it will escape more years than it will be winter killed.

The farmer's life is a gamble against weather, bugs and commission men. The weather is more often favorable than unfavorable; some years the bugs are not bad, but the commission man is sure to be on hand for his pickings.

Corn.

The next great crop for the stock man is corn. Indian corn. The White Dent varieties do best in this neighborhood. Everywhere in the interior part of the state this should be the great staple feed for stock on the alfalfa pasture. It supplies the natural balance of carbo-hydrates, against the protein.

The dairyman wastes the corn by cutting and feeding it green. For this purpose he could plant sorghum and save the corn for the silo. Then the late summer and early winter is added to the year of green feeding and the milk fills the pail without regard to the seasons. The cows fed on silage, frisk and have keen appetites.

Silo.

There is nothing new under the sun, only men forget and have the pleasure of rediscovering the same things over again. The early dwellers around the Baltic put grass into pits in the ground and preserved it green for the cattle.

The French peasants of the 17th century put green feed into stone quarries and caves, and covered it up. These tales, as well as the description of ensilage stacks, were told in a French book of Agriculture.

About forty or more years ago, a Virginian built a silo patterned after a plan in this book, but until the seventies, it remained a curiosity, then it suddenly became a success.

Government Work.

The farmers of the United States started a Grange movement and finally said to the law makers at Washington, "give us more attention! Let the arts of peace be placed on as important a footing as the science of war."

I think the ghost of the Billy Penn must have turned over and said—"Aha! Ha!" in real ghostly rejoicing, when the strength of the Government was turned to practical investigation of the ways for farmers to produce the best crops.

The state experiment stations have become a force in the land. Every young man that graduates at the Cow College at Berkeley, has a position offered him before he is ready for it, while the other boys are hunting work.

Now the silo has been pushed and urged on the people by the Department; even Secretary Wilson has been converted from making fodder of corn, to putting it into the silo.

It is said that in 1899 there were about 70,000 silos in the United States. Today, there are about 200,000 and more building every day. I no longer feel that I must say to everyone how good a thing a silo is. Have not the progressive dairymen of every locality already adopted them?

I nave never found a way so cheap to produce a pound of butter as by using well-eared corn in a silo, and feeding it with plenty of alfalfa hay. Thirty to forty pounds of silage and ten pounds of alfalfa hay a day for each cow will keep up a good milk flow.

Grain Ration.

The selling of butter or milk from a cow that produces twenty-five pounds of milk a day, or makes ten pounds of butter a week, will be profitable on silage and alfalfa hay. Now, if this cow has more capacity, she may be pushed into higher production, by giving her grain, then watch her closely and sell her only so much as she pays a profit on. Do not let the cow give you no returns for the feed and extra labor of handling a grain ration.

The many stomachs of a cow makes her an animal that requires bulky food. It is expensive and not healthy to feed a concentrated grain ration, if the cow is to be used as a breeding animal. The high prices of today make it possible to carry an inferior animal, if she is not expensively fed.

Milkers' wages are higher, and nearly offset the high prices the dairyman is receiving this winter for the butter fat. When the prices fall many a cow will go to the shambles that is now being milked.

Horses and Colts.

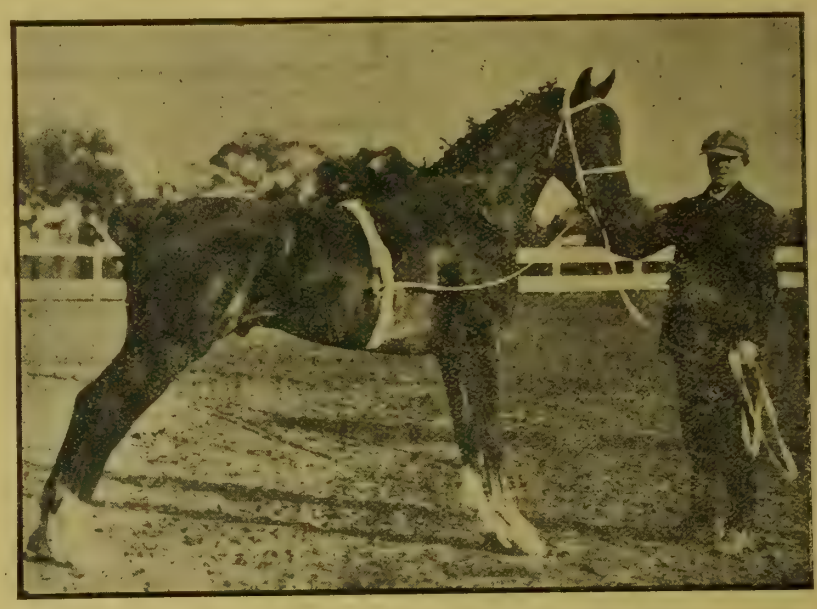
Twenty pounds of silage divided into three feeds, is all it is well to feed a work horse. This, with twelve pounds of mixed alfalfa and grain hay, will keep most of our horses in good working order. Ten pounds a day, is enough for the colt running on pasture. The pigs can also receive a limited amount. Usually they receive the cleanings of the mangers from both horse and cow barns.

Cost of Silo.

About the average cost of a wooden silo has been $1.40 to $2.00 per ton capacity. What it would cost at present high lumber prices I should not like to say.

The cost of the silo is less than a hay building, as the same number of cubic feet have a greater tonnage capacity in weight for silage than for hay, averaging nearly three times as great. The silage at the bottom of the silo becomes compressed and weighs more than that at the top. The silo is merely a giant can that is air tight on the sides; into it we can put the green corn, oats or alfalfa well wetted.

If we desire to do so, it is ready to feed out at once, or it can be left until the heat developed drops down to sixty degrees, then Nature will seal it tightly with a coat of mould; that makes it impossible for air to penetrate.



Imported Hackney Stallion, Changue Squire

First Prize Winner Pasadena Horse Show, 1907.
Imported by Wm. McKie of Los Angeles, and Sold to R. F. Carmen, New York.

Canning.

The silo is merely a giant can, as before stated, in which the heat made by the food acts as a sterilizer and a driver out of oxygen. Then a growth of mold seals it air tight. The cows without silage are like we would be if we had no fresh fruit nor canned fruit or vegetables, but had to eat dried apples and prunes all winter! Good corn silage! How sweet it smells! How appetizing it smells around the barn. If the cows ever drop into poetry like Silas Wegg, they would sing of it, "is sweeter than honeycomb," and more to be desired than the condimental foods that men buy, unwisely, at ten cents a pound for a treat for the cows.

Dr. Dietrich.

It is a paradise for cattle where corn and alfalfa are easily and cheaply grown. If Dr. Dietrich, with his intensive farming, was in California, instead of 21 head of stock on 17 acres of land, I think he would probably have a horse, a cow, a colt, a sheep or a goat, tied at every fence-post on the ranch and then cry out it is more than enough for all.

Intensity.

The richness of the land, the warmth of the sun and the wetness of the rain in California are more intense or at least they take hold of one's mind more deeply with greater intensity than elsewhere; we love them better and are more alive, in our daily life, to the natural world around us. The live-stock feel the same intensity of the atmosphere around them, they respond quickly. An experiment is quickly tried with them. If they like their feed they show it. Some of the older cows used to almost talk when something new was added to their ration. They were pessimistic, to be sure, that always grunted disapproval. Cows could hardly be expected to be better than people.

Corn Crop.

The corn crop will make ten to twenty-five tons of cut corn to the acre. This crop occupies the land from 100 to 110 days, from sowing to maturity.

It can be planted as late as the 4th of July, using land that grew a wheat crop. We sent from the ranch to the Fresno Chamber of Commerce a sheaf of oats seven feet tall, and a sheaf of corn twelve feet high, that grew on the same piece of land the same season.

This we have done year after year planting the oats for silage, mixing in common garden peas, putting them in in December or January; these are ready to cut in April or May. They go into the silo, the land irrigated and corn drilled in, after 100 days this is cut for silage also.

Other Feeds.

The silo can be filled with any green food that cattle consume. The clippings of herbage around the orchards and vineyards will furnish food for stock. The fact that the silo need not be emptied before refilling is an advantage, for the feeding can go on and the crop that comes along can be put into the vacant space and fed right out.

I have had the last ten feet of silage, in one silo, as long as seven years, it grew so compact that the men had to loosen it up with a mattock; the cows ate it readily.

In the spring the foxtail comes, it is tender while young, and is rich in milk-producing elements. Soon, however, it puts on its defensive armor and then it is a terror. If it is cut when first headed and the whole mass put into the silo, it makes excellent feed.

The heating the seeds receive kill their vitality. The last crop of alfalfa is wasted by leaving it on the field to freeze; it should go into the silo.

The alfalfa fields will after a few years grow cleaner hay and make heavier crops than when foxtail and weeds overrun the pasture. If the foxtail or weeds put into the silo are not eaten by the cow they go back to the land, as humus to feed the growing crop.

The Best Crop.

The more humus the soil contains the better will be the crops—more corn—more alfalfa—more cows—to make more butter and milk; butter for the rosy-cheeked boys and girls and milk for the babies.

These are California's best crops—better than her gold, her lumber, her crops, and her stock, her grapes and oranges—are the sturdy native sons and daughters.

These are the pride and joy, they are fed the best the land affords, for if they have wholesome, well-nourished bodies, they will think right thoughts. Then will we be blessed indeed, for no country is greater than the physical perfection and mental poise of her citizens—that makes them sane, reasonable and law-abiding.

DAIRY TALK.

Don't fail to wash milk vessels and dairy utensils as often now as in summer, just because it is cold. Milk does not sour so quickly now that it is cold, but vessels become as dirty now as they do in midsummer.

Warm water is an excellent thing for cows giving milk. If you mix meal and shorts with it all the better, if not too much is given. The quantity will vary with the character of the feed and the cow. A little good judgment then, is a good thing as everywhere else.

It is supposed that up-to-date creameries pay on the test basis, because it is the only proper basis of payment. It gives you credit for just what you sell, and it gives the creamery men just what they buy.

Coulson's Special Dry Chick Food

Feed to Your Chicks

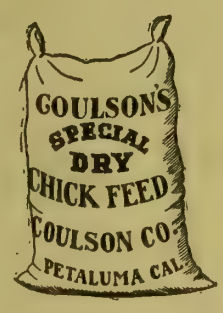
We Sell
COULSON'S SPECIAL
DRY CHICK FEED
THE BEST FEED FOR LITTLE CHICKS AND TURKEYS
COULSON POULTRY & STOCK FOOD CO
COULSON'S SPECIAL DRY CHICK FEED

And See Them Grow

Advantages of Coulson's Ready Mixed Chick Feed

The proper feeding of poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

Chicks should be given a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are best adapted to give nourishment to the growing chicks: Sweet tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other things.



It is clean, sweet feed that is easily digested, and chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks, at a cost of about 4 cents apiece.

Ask your feed dealer about Coulson's special and be sure that he does not sell you something else.

If your dealer does not keep it, write us, and we will tell you where and how to get it.

To be able to raise the chicks that you hatch and have early broilers to **SELL AT A HIGH PRICE**; to raise **NICE LARGE HEALTHY CHICKS**; to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Coulson Poultry & Stock Food Co., Petaluma, Cal. Milwaukee, Ore.

Gentlemen:—

While in the poultry business I have tried several brands of Chick Foods and find COULSON'S SPECIAL far superior to any other brand.

Yours truly,

(Signed.) Floyd W. Scott.

Power Plants for Progressive People

Courtesy International Harvester Company

ON EVERY FARM there is certain work to be done, such as water raising, corn shelling, wood sawing, fodder cutting, feed grinding, cream separating and churning, as well as a thousand and one other operations, that are expensively accomplished with any other than gasoline engine power.

Hand power is antiquated, and at best, time-consuming and back-breaking; horse power is unsatisfactory and expensive; wind power is unreliable and seldom available when wanted; and as for steam power, the disadvantages are so many that it is hardly necessary to mention them here.

Gasoline (and lately alcohol) engine power has come to replace all these methods. It is not only economical and reliable, but it is actually a source of pleasure. It is so readily accessible at all times, so clean, and requires so little attention and worry that it makes many of the operations about the farm pleasant and profitable instead of disagreeable and unprofitable.

In California, more perhaps than any other state in the Union, is the gasoline, distillate or alcohol engine needed, because the necessity of raising water on a great majority of our farms; while upon many others the primary necessity is still for power, to use in other ways. Cheapness and availability of fuel, with congenial weather for its transportation at all seasons, make our state an ideal one for the universal use of farm power plants, and no up-to-date farmer holding extensive acreage can afford to be without one.

To be able to raise the chicks that you hatch and have early broilers to **SELL AT A HIGH PRICE; to raise NICE LARGE HEALTHY CHICKS;** to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Coulson Poultry & Stock Food Co., Petaluma, Cal. Milwaukee, Ore.

Gentlemen:—

While in the poultry business I have tried several brands of Chick Foods and find COULSON'S SPECIAL far superior to any other brand.

Yours truly,

(Signed.) Floyd W. Scott.

Eucalypts Used for Timber and Fuel

A Bulletin Recently Issued by the Forest Service, U. S. Department of Agriculture, Under Direction of

GIFFORD PINCHOT, Forester

SEVERAL species of Eucalypts are suitable for planting in the warmer parts of the United States, but the qualities of the most important are so much the same that only their differences need be referred to. Blue gum is the most extensively planted, and may therefore represent the type.

Blue Gum (Eucalyptus globulus).

The blue gum is an evergreen tree, with smooth, elongated leaves of leathery texture and usually sickle-shaped. Under favorable conditions it grows very rapidly and may attain a height of 150 feet and a diameter of from 3 to 5 feet in thirty years. The form is always slender, though, like most other trees, its crown spreads moderately when given plenty of room. In close stands the stems rapidly clear themselves of branches to a considerable height, but they are rarely straight.

The blue gum is not native to the United States, but was introduced from Australia. It has been widely planted in Central and Southern California, and to some extent in New Mexico and Arizona. Its range is limited by the fact that the young trees cannot withstand a lower temperature that 25 degrees F., and it is useless to plant the trees where greater cold occurs. The directions here given are therefore applicable only to limited regions. In California the trees are confined mainly to the citrus fruit belts, although in places the planting range has been successfully extended beyond these limits.

Blue gum can adapt itself to many kinds of soil, even that containing considerable alkali, but it is entirely dependent upon a plentiful supply of moisture about its roots. Without that, it grows slowly and does not sprout readily. The soil best suited to it is a deep, sandy loam, with ground water within 10 or 15 feet of the surface. In many localities the lack of water is supplied by irrigation, but as a rule irrigated land is too valuable for commercial plantations. Atmospheric moisture is not at all necessary; on the contrary, the tree grows fastest with its roots close to water and its crown exposed to the sun and wind.

Blue gum develops a strong taproot and a vigorous secondary root system, both of which are capable of penetrating to considerable depths in search of moisture.

The tree is extremely intolerant of shade. Its seedlings thrive for a time beneath the old trees, but if the cover is at all dense they make only a slow growth. This indicates the need of so managing a grove that each individual has its crown entirely free.

It is practically free from injurious insects and fungi. Damage from wind is to be feared only on very shallow soil.

The wood is very heavy, hard, strong and tough, but not durable. It is easy to split when first felled, but not after it has dried. It resembles hickory in many of its qualities, but is extremely difficult to season. The trees are sometimes sawed into lumber and used for wagon work and agricultural implements, though for none of these purposes is the wood as good as that of sevefal native species. It is coming into use for piles in sea water, and it appears to be quite valuable for that purpose, though the trials are not yet conclusive. Its chief value at present is as firewood, for which it is in constant demand in parts of California where other good fuel is scarce. This recommends it for commercial plantations. Another important use of the tree is for windbreaks to protect orange and lemon orchards from the high winds that are prevalent in many parts of the fruit-growing section. No other tree will make so good a shelter-belt in so short a time as blue gum.

The blue gum reproduces freely both by seeds and by stump sprouts. Plantations must be established by seedlings, but the vigor of the sprouts recommends that means of renewing a grove when it is cut.

The seeds are produced in large quantities every year. Most of them ripen in the fall, usually just before the rains. The fruit should be gathered before the valves open, and spread on sheets in the sun. In a few days the seeds will be freed and may be easily separated from the hulls and chaff. They should be planted at once in shallow boxes filled with not less than 3 or 4 inches of sandy loam, or in small paper or bamboo pots. The box most commonly used is 18 by 30 inches and 3 inches deep. It is better to plant the seed in this way than in seed beds, because the boxes or pots make it posible to transport the young plants to the planting ground without taking them from the soil. The seedlings are very tender and may easily be injured by exposure of their roots to the dry air. The use of boxes also serves to keep the young trees from developing taproots so long that they cannot easily be transplanted. Two or three seeds should be sown in each pot, or in groups about 2 inches apart in the boxes, and covered with about one-quarter inch of sand. The boxes should be kept moist until the seeds germinate, which they usually do in about ten days. After that time they may be set outdoors and the plants left to be watered by the rains, or they can be housed and watered artifically. In either case the plants should be watched, lest they become too wet and suffer by the fungous disease called "damping off." Where the seedlings come up thickly, it is a good plan to take from each pot or group all but the one strongest plant, and to transfer the rest to other boxes. This should be done when the plants are about 2 inches high.

Toward the end of the rainy season, or about the first of March, the seedlings will be about 6 inches high, and may then be taken to the permanent site and planted out. If grown in pots, the whole thing may be set in the ground, and the paper or bamboo left to rot. If boxes are used, each plant should be removed from the soil and set at once in ground previously prepared with plow and harrow. If the ground is dry, it will be necessary to water each young tree as soon as it is set out, and perhaps to continue watering for a year or two, but the trees should gradually be accustomed to do without irrigation. The planting of Eucalypts for commercial purposes is not advised where the trees cannot find their own water within two years.

For wood-lots a good spacing is 8 feet by 8 feet. This gives room to cultivate the young trees, yet sets them close enough to grow tall and clear. The plantation should be cultivated frequently for two years; at the end of that time it should be able to take care of itself.

This method of propagation is recommended because it takes advantage of the rainy season to grow the seedlings and get them established before the air becomes very dry. Some growers do not plant the seeds until spring, and a few sow the seeds in the permanent site or collect wild seedlings from an old grove. Any of these methods may be followed, though the first described is apt to be the surest and best. Those who contemplate planting will naturally compare the cost of seedlings from a nursery with the cost of those they may raise.

It is decidedly unfortunate that blue gum cannot be planted more widely for windbreaks. If set out with an orchard, the windbreak will easily keep ahead of the fruit trees. In most cases it will attain a height of 50 feet or more in six years, and of 100 feet in ten years. The great value of blue gum for windbreaks lies in the facts that it grows very tall without taking up much ground, that it is firm against all winds but tornadoes, and that its crown is flexible and elastic, and, by bending, diverts the wind diagonally upawrd, instead of offering a resistance that forces it to go through in strong currents. On the other hand, there is the disadvantage that the clear trunks offer little opposition to the wind near the ground. This, however, is easily overcome by planting a close row of cedar or cypress next to the gum.

Blue gum windbreaks are most effective when composed of two rows of trees set 4 feet apart; the trees in the two rows alternating instead of being opposite.

O O O O O O

O O O O O O

Many planters, however, are satisfied with a single row.

The intervals between parallel windbreaks will vary according to the character of the local winds, but in most parts of California it is thought best to have them not more than 400 feet apart. The trees may be obtained, planted and cared for in the same way as those in wood-lots.

Either Monterey cypress or Italian cypress is recommended for the lower part of a composite windbreak. Both grow quite rapidly and will maintain a dense hedge to a height of from 30 to 40 feet. One row of blue gum and one row of cypress are all that is necessary. The latter may take the place of the leeward row of blue gums indicated in the diagram above, though when the cypress trees are about 10 feet high every other one should be removed leaving them 8 feet apart. The blue gums should be maintained with their original spacing of 4 feet by planting a new tree wherever one dies.

Deciduous Fruit Culture

By J. W. MILLS

PLANT TREES RIGHT.

IT IS quite a common idea that it is best to plant a tree a little deeper in the orchard than it grew in the nursery. Just why this idea does take hold of some people we do not know. It is, perhaps, because they think that the trees have been deprived of part of their roots and in order to allow them to get as deep into the soil as possible after taking them from the nursery, they give them a good start by putting them down deep to start with.

Recent experiments carried on by systematic planting of trees at different depths showed that the size of the trees and the development of the root system decreased with every increase of depth of planting. For those who think there is something to be gained by deep planting should change their minds if they believe this record. This experiment was made in one of the government experiment stations in Germany. We have had the same experience with Bartlett pear trees ourself in a certain way. The trees up to two or three years did very little growing when we removed about six inches of soil from around the base of the trees, exposing the bark to the point that was on a level with the ground in the nursery. After this the trees did much better, but not as well as those which were properly planted in the first place.

WALNUTS DAMAGED BY FRUIT.

Some experiments were made several years ago in Fomona, showing the bad effect of dipping walnuts. At a farmers' meeting, nuts were shown that had been submerged in water for 10 minutes. Before the treatment, they were closed perfectly tight. A few hours after they had nearly all opened at the apex, showing that they had absorbed enough water to open them and thus permit the kernels to be exposed to the air and as a consequence to become rancid after a certain time. It is a fact that hard shell nuts keep sweet longer than soft shell nuts. It was also brought out at the meeting that some dried fruit and walnuts in boxes had been stored in the packing house, the boxes being stacked closely together, the walnuts had absorbed enough moisture from the adjoining boxes of dried fruit to cause them to open. This would, of course, cause the nuts to become rancid sooner than if they had never been allowed to become opened even slightly. Many were much surprised to know that the walnut was so susceptible to so slight a degree of moisture.

SPRAYING INSURES FRUIT.

At the Southern Illinois Horticultural Society meeting W. S. Ferrine, a Western fruit grower, who marketed 15,000 barrels of apples the past fall, read a paper that contained valuable suggestions, as follows:

When the conditions are most unfavorable, he said, there is the greatest need of thought and persistent work with the spray pump. But even this year, with conditions extremely favorable, the reward for intelligent and thorough spraying and the general care of the orchards this year and the previous years was very great. Up to within a month and a half or two months of the picking time unsprayed orchards looked practically as well as sprayed ones, and in some cases better, but by picking time there was a great contrast in favor of the well-sprayed orchards.

Very many of the unsprayed orchards that helped to swell the early crop estimate, did not materialize at the barrel, there being practically no fruit for the barrel. On the contrary, many of the sprayed orchards barreled more than they promised. Therefore, I say that even this year a heavy outlay for spraying, cultivation and fertilizing paid a very large dividend on the investment.

This year has again proved that a neglected orchard is an unprofitable piece of property to the owner, and a public nuisance, while a well-cared-for orchard is a profitable posession and a public blessing.

This year has taught us that the grower must not depend on the buyer to come and harvest his apples, or even to buy them after they are harvested. Quite a large per cent. of the apples in the Middle West went to waste simply because the growers made no provision for handling them.

This year has taught that there will always be a market for good apples, and in barrels, at that. Thousands of barrels of No. 1 virtually went to waste that would have brought from $1.40 to $1.50 or even more f. o. b. if they had been barreled in a good shape at the proper time.

Pernaps this year ought to teach us the principle of fewer acres and better care, certainly of fewer orchards unless better cared for. Unspraye . orchards are a breeding place for codling moth and other insects to reinfest sprayed orchards.

PERSIMMONS.

There is a spasmodic demand for information on persimmon culture that comes with the unequal bearing of the trees. When the crop is light the prices are high, and it is at once presumed by some that the persimmon is a profitable crop to raise. The character of the fruit is such that a few specimens satisfy most persons. They have that dead sweetness, totally devoid of acid that is perceptible, that is cloying. It is, however, a delicious fruit for a change, but can never be compared with the apple, orange or peach or many other kinds too numerous too mention.

There are numerous varieties of persimmons that are propagated and are true to type. The only varieties worth raising in California for market are the Japanese varieties. Hachiya is a favorite, being delicate in flavor. It is oblong and conical in shape, with few seeds.

Hyakume is a large persimmon, shaped like a tomato, pointed at the apex. The flesh is a rusty brown in color and lacks the astringent property that most varieties have. Yemon is a very fine persimmon, large and of fine flavor. It ripens early and is at its best when very soft. In fact, all persimmons are at their best when they can be cleaned close to the skin with a spoon.

BUYING FERTILIZERS.

There is one reform that is much needed in the purchase of fertilizers, and that is a change from the almost universal practice of buying on the flat ton rate.

When fertilizers are bought on this basis, farmers often pay practically the same price for different fertilizers whose compositions necessarily make their commercial values vary considerably, and one may rest assured that he pays too much for the brand of lower value instead of too little for the brand of higher value.

The brand or name stands for what the manufacturer thinks is best suited for the crop for which the brand is intended, or else it stands for what the manufacturer wishes the farmer to think is best suited for his crop, in order that the manufacturer may dispose of, at best advantage to himself, fertilizing materials on which he has a corner, or which he can procure on more favorable terms than others.

It is often the case that the immediate financial returns influence the agent's theory of fertilization. Thus it is that some dealers will declare that experience has definitely settled it that organic nitrogen from animal sources is best for most, if not all crops, and these are the dealers who are directly or indirectly interested in the packing industries.

On the other hand, some are very positive that nitrate of soda should be the source of the greater part of the nitrogen, and investigation might disclose the fact that nitrogen in nitrate of soda is the cheapest form for this class of manufacturers. Some will declare with authority that superphosphate made from phosphate rock is superior to superphosphate made from bone, and vice versa (when there is no difference), and one does not have to look very far to find that each party is inter-

Z. A. MACABEE, LOS GATOS, CAL.

ested in the material which he advocates.

Still others will say that non-acidulated bone is the best form of phosphoric acid, and it would not be surprising to find that the dealer in this class finds greater profit in handling untreated bone, or else that he is not prepared to acidulate his materials.

It is not intended to discuss here what materials are best suited for various crops under various conditions, but to suggest to the buyers of fertilizers that they should know what they want and then go to the fertilizer dealer to supply their wants.

In short, it is intended to suggest to the farmer the advantages of buying fertilizing ingredients at a definite price per unit, instead of buying "brands" of fertilizers on the ton basis. The fertilizing ingredients may be bought in the unmixed materials, or they may be bought mixed in proportions which seem best suited to the farmer's need, but in either case the transaction should be on the unit basis.

A unit of a fertilizing ingredient is one per cent. in a ton. Thus, if nitrite of soda contains 15½ per cent. of nitrogen, one ton contains 15½ units of nitrogen. In other words, the figures that are used in expressing the guaranteed analysis express the number of units in a ton of the material.

Buying fertilizers on the unit basis means that the dealer must state how much he is charging per unit for available and insoluble phosphoric acid, or if does not guarantee available and insoluble phosphoric acid, how much he is charging per unit for total phosphoric acid; how much per unit for each form of nitrogen, and how much per unit for potash.

This then puts the purchase of fertilizers strictly on a competitive basis, and the buyer is at once able to say who is giving him plant food at the lowest price. It does away with all hidden virtues which lurk in the "so much per ton" mixed fertilizers. Of course throughout the transaction the farmer must not lose sight of the quality of the materials used and the mechanical condition of the fertilizer.

This basis of purchase also affords a just basis of settlement in case goods do not come up to guaranty. If the fertilizer has fallen short in one or more ingredients it is a simple matter of arithmetic to arrive at what should be paid for the goods on the basis of the agreed price. The farmer should never forget that he is buying and using pounds of nitrogen, phosphoric acid and potash, and not tons of "fertilizer."

It is not sufficient for the dealer to quote a price per ton and say that this price is made up on a reasonable price per unit for the ingredients. The price per unit for each ingredient should be given.

If farmers would stand together in demanding this basis of dealing it would be a very easy matter to obtain it. If the manufacturer objects to this plan, the farmer may remind him that it is the basis on which he buys his own materials. If it is good for the manufacturer, why is it not good for the farmer?

The question is often asked, is it better to buy mixed fertilizers, or to buy materials and mix them on the farm? The answer is very simple. If the manufacturer mixes them better and cheaper that the farmer can mix them, then buy the mixed. The question of cost of mixing can be determined by getting the cost of ingredients in the unmixed materials and in the ready-mixed fertilizers.

All the materials which enter into the mixed fertilizers may be bought unmixed in the market. But in buying the unmixed materials care should always be exercised to obtain them in a finely ground condition. In mixing them, the bulkiest material should be placed in an even layer upon a tight floor, the others above this in order of bulk, then begin at one end and shovel the pile back. Rpeat the operation once or twice or until the materials are well mixed.

MILKING MACHINES.

THERE seems to be little doubt in the minds of those that are in close touch with the dairy interest of the East, that the milking machine is no longer a fad, but of practical use to the dairymen.

In a few years it is believed, the machine will have superceded the present untidy milker. The matter has reached the limit of forbearance, the industry is being injured and the people driven from using milk by the conditions under which much of it is produced.

Women Milkers.

The excess of dirt in the milking pail is rather a modern addition. It came when dairying became a commercial business. In the former days when the distance between the cow and the consumer was shorter, the dairy cow was milked by the farmer's wife and children.

After the family wants were supplied the excess was sold. It was usually a clean lot of milk or butter for the matter was a personal one between the woman of the farm and the woman that used the milk and butter.

Man Milkers.

When dairying became the farmers' business, the women could no longer milk the long string of cows necessary. Then came the man milker and the mussing.

A dirty pair of overalls stiff with many milkings, tobacco stained fingers, and a good, loud smell was his get up to go into the milking barn. It was a sad day for Bossy when her woman friend with a clean apron, her personal friend, left the barn to the hired man that regarded the cow as a machine, not a creature full of sensitive sympathy with its surroundings.

Clean Men.

Today when a man really looks clean on the ranch, we are apt to say to him, "were you in the Philippines or Cuba?" The army and navy do train men to be clean personally, whatever sort of souls they may have naturally.

The Swede and Dane are cleaner than the native Americans, but usually they are not milkers, but buttermakers, as they nearly always work up rapidly to the better paid positions on the ranch. The south of Europe people today furnish the mass of our dairy help.

They are not clean or human by nature. The animal to them is simply something to be hammered if it does not do as they wish it to, not to be trained carefully into doing its best. The dairymen today are greatly dissatisfied with the milkers.

Separators and Milking Machines.

The milking machine is a crying need. Today, it is being used in a thousand dairies in the United States alone. While not perfect as yet it will not be long until the imperfect points will be found and remedied.

Today, the milking machines are giving as good service as the separators did in the eighties, and the separator is nearly a perfect machine doing clean skimming with a small amount of power.

The milking machine is coming to perfection as quickly. Sanitary milk will be a possibility for every dairy to produce and cheap enough for every family to use. The greater the need the sooner will come the perfected article, for when many minds are directed to one point they seem to act as a great brain wave and the same invention or the same thought springs up in more than one mind at the same moment.

Less Expense.

One man milks three times as many cows as under the present hand milking system, the machine may therefore cost considerable when set up with the power to run it, and yet be enough cheaper in operation to leave a good margin of profit.

I like the idea of paying one good, clean man high wages rather than three or four of the present type at the rate of $35.00 to $40.00 a month for their untidy incompetency.

The large machine I saw was a Lawrence-Burrell-Kennedy. I note that this seems to be the one that well-known men like Mr. Gurler speak of with approval in the dairy press.

Operating.

The milking machine may then he assumed to do fairly good work, as good and more uniform than the ordinary milker. The machines are simple enough for anyone to undersand. One man told me he made the only possible mistake with his machine, in that he allowed the milk to be drawn up into the vacuum pipes, but, as he said, it was purely nervous excitement that did it.

The mistake was made right by

simply running clean water at once through the pipes for half an hour. A six horse gasoline engine furnished power for the four machines at work, milking eight cows at one time.

The Cow's Side.

Only one cow was restless under the machine, the cups or discs fitted a little too tight on the teats. The owner thought this cow he would sell as she was gentle under hand milking, and not of value enough to take extra trouble with. It is said that sometimes it startles a nervous cow if the cups drop off during the milking.

The cow that is milked from the wrong side is often a little troublesome at first, but is broken by using the machine at first on the right side and then changing it over to the other one.

The heifers take more kindly to the milking machines than to hand milking, probably because it is more regular than the ordinary milker's work. The boys on the ranch call themselves "Cow Juice Jerkers;" I think it is a good description of much of the milking.

Strippers.

At first it was thought necessary to strip by hand, but after following this up in one dairy of fifty cows it was found that only two quarts of milk were gained. It was also found it was the cows that were going dry that gave this milk, not the fresh ones.

Now, it is said that the best results are obtained by breaking in a herd by degrees. The fresh cows are milked by the machine as they come in, while the cows that have nearly finished their milking period are allowed to go dry under hand milking.

The cows going out of milk are more nervous and dislike changes, as they have their brain forces centered in protecting the coming calf. They resent changes of any sort. A fresh cow is contented if she has plenty to eat and something to relieve the distension of her udder.

Be Gentle.

Gentleness and kindliness are necessary at first in introducing anything new into the lives of the domestic animals. The heifers being young do not resent changes as much as the older cows in whom habits have become fixed. Take a cow in the flush of milk, when the udder is tender, the drawing off of the milk is a relief and if gently done is pleasant.

The machine is regular and quiet, it does not stop to gossip or cut off a chew of tobacco, but keeps evenly on to the end. The sense of lightness that follows the removal of the milk from the udder is evidently great. Watch the cows entering the barn with the veins and udder engorged stalk stiffly and slowly along.

After milking is over they move out of the barn briskly with a happy air of relief. It has been found easiest to break them to new ways when the new way is pleasant. While it may be a long time before we all use milking machines, yet certainly with pleasure for clean milk on the dairyman he must move toward it. At present, sanitary dairying raises the price of milk to a luxury that puts it out of the reach of many families that have young children to feed.

The riches of a poor man are said to be his children, but that was in the happy days when there was abundant food. Now that all food stuffs have to be handled and so many have to make a living merely as sellers, the prices to the consumer are high, while the producer is too poorly paid to hire the proper labor to keep the cows in a sanitary condition. Cheap milk has nearly come to mean dirty milk, or at least milk that is only by happy accident clean.

O'Rourke—Do yez know where yez would land if yez raised your hand to me?

O'Lafferty—Shure, roight on your lift eye.

The Vital Parts of a Studebaker Are Made Just Right

The vital parts—and *every* part of the Studebaker wagon—are made just right!

That's why the Studebaker is the most economical—costs you less per year.

They last longer—so the original cost is less per year.

They need fewer repairs—so the repair cost is less per year—not to mention saving in time.

They are lighter draft—so they cost you less in *horse flesh*.

Horses cost more than wagons; light draft saves horses.

Studebaker wagons run more easily than others because each wheel is perfectly proportioned, with the box of the hub set in the exact center.

The skein is so set that the wheel runs straight ahead under a load and cannot rub, bind or grind on the skein.

Studebaker hubs never hug either nut or collar. That's another reason why the Studebaker is of such wonderfully light draft.

It makes hard loads easy for horses.

* * *

And it stands up under hard loads.

The Studebaker has a carrying capacity at least 40% greater than that of the ordinary wagon—

Because skein, axle, spoke, hub and tire are made *just right*.

Go to the Studebaker Agent

The skeins, by actual test three times daily in our factory, have a transverse strength 25% greater than that required by the United States Government.

The axles are ¼ inch deeper than others, and are made from selected butt-cut Black Hickory, air-dried from 3 to 5 years.

The hubs are extra large in diameter—made from the best procurable wood.

The famous Studebaker slope-shoulder spokes carry the largest amount of wood into the hub, and are strongest where others are weakest.

The tires are *cold-set*, and are perfectly fitted to each wheel so that there is no such thing as a quickly loosening Studebaker Tire.

At every point of construction, all that can be done, *is* done, to make the Studebaker a perfect wagon.

No wonder the Studebaker lasts!

No wonder the largest and best equipped vehicle factory in the world is required to meet the demand for the Studebaker.

See the Studebaker Agent

Let him show you a Studebaker wagon, or carriage or harness. They will talk for themselves. Ask him for a free copy of the *Studebaker Farmers' Almanac for 1907*.

If you don't know the agent write us. Enclose a 2c stamp and we will send you the almanac free.

STRENGTH

DURABILITY

SIMPLICITY

A cream separator that is worth buying must give **long service.** To do that, it must be built strong and the **construction** must be simple. To have simple construction in a separator you must have a Sharples Tubular. There is no other cream separator made that will perform its work so well for so long a time as the **Tubular** because there is no other separator so strongly built, or so **simple** in construction.

Sharples Tubular Cream Separators

get all the cream, have low supply can, are easy to run, easy to clean, because there is only one little piece in the bowl to cleanse after each running, and the machine oils itself. It combines **Utility, Simplicity** and **Durability.** A glance at the pie-plate construction of most separators will give you a fair idea of what we mean by "simple construction" and "strength." For full information about the Sharples Tubular write for booklet E. 260

Mr. R. Carpenter, Davenport, Wash., says "Having used a Sharples Cream Separator over sixteen years can say it is just fine."

VALUE OF SKILL IN MILKING COWS.

Many people think that milking is a job that can be done by one person about as well as another. This is a mistake, as any thorough milker knows. As a writer truly says:

The art of milking is considered as being on a level with pumping water, etc., and yet there are many points needed to stamp a man as a good milker. Too many children are allowed to attend to this important work and many of the chronic troubles of the cheese factory originate right here. A good experienced milker can soon tell if there is something wrong with the udder and milk, and will not allow such milk to be delivered to the factory; but what can you expect of a child? Cleanliness is absolutely collateral to good success in the factory. Everybody knows this and yet you can notice cows being milked that have udders covered with dirt, mainly caused by the swamplike condition of some of the barnyards.

And the milk utensils, do they always get the proper care? Are they always properly washed with hot water and kept in proper places? Are they used exclusively for their purposes alone? I think not, or else the collection of things of all variations delivered with the milk would not be so large as it is. It seems to me that it would be a step in the right direction if we would follow the example of the dairy farmers in Switzerland, who arrange milk courses every year, where the proper care of cow and the milking is taught in all its important details. We certainly need something of this kind.

ENLARGING THE INDUSTRY.

There are many evidences of increasing interest in sheep in the northwest, says a writer in Stock, Farm and Home. Possibly one cause for it is that increasing financial ability of farmers makes the matter of fencing less of a barrier to sheep growing than formerly. Then there is no doubt that knowledge of the sheep and its usefulness on the farm is expanding, which invariably results in increasing the number of flocks in a locality. The higher price of wool, and of the animals as well, has also tended to increase the disposition to make sheep-growing one of the farm's industries. The last consideration should be a minor one, however, because he who looks upon the sheep as a money getter solely is less likely to be successful with it than one who rears sheep because he likes them, has faith in them, and feels lonesome without them; factors that make the true shepherd.

At all events, the sheep sentiment is growing, and growing conservatively, too, which is the best feature of all. There seems to be no rushing into big flocks by the inexperienced, but many farmers are starting with a few, intending to enlarge the flocks as knowledge of how to handle them increases. This is the proper way, and when sheep husbandry is so embarked in on a farm the place is not likely to be sheepless from that time on. The United States should not import half the wool their people consume.

FAMOUS ILLINOIS HOLSTEIN.

Rose was the most famous cow in Illinois in recent years. She died recently, aged 16 years and 10 months, and her record as a milker is going the rounds. She dropped her first calf at the age of 2 years 9½ months, gave milk fourteen years, and was in milk and with calf when she died.

For twelve consecutive years she gave an average of 7,258.5 pounds of milk—largest record for one year, 580.6 pounds of butter fat. In the first nine months of her last lactation period she produced 350 pounds of butter fat.

The fourteen-year record of this wonderful Holstein is given by the experiment station. It was 49 tons (seven carloads) of milk, containing 4,858 pounds of butter fat equivalent to 5,468 pounds (or nearly 2¾ tons) of butter, worth at 25c a pound, $1,214.

The chief dairy husbandry of the University of Illinios thus comments:

"The twelve-year record of Rose and her pioneer identification with these discoveries (all made by weighing and testing the milk of individual cows throughout the year) have given Rose a distinct mission to dairymen everywhere, a mission of far more value than the tons of milk she gave and the dollars she returned her owner. And this is her message: In almost every dairy herd are several very good and several very poor cows, but the dairyman does not know how good or poor they are. The difference is surprising and vital to the dairy business. It is the difference between success and failure, between poverty and plenty. Find out what each cow is doing, or isn't doing (by weighing and testing her milk). Keep the good cows and keep no others. Let the memory and record of Rose ever stand, first, for a definite knowledge of this difference in production; and, second, for a settled policy of improvement of the herd. Standing for this, Rose will yet save the dairymen, who are milking the million cows of Illinois, 4,000 times $1,200 every year instead of returning one owner $1,200 in twelve year."—John Appleton in Town and Country Journal.

It Tells at the Pail

Give the cows what they need and they will give you what you want. No mystery about it. We don't claim to balance the ration, but we do claim to improve digestion by supplying the animal with exactly what the noted medical colleges and authorities claim the animal needs to increase production. No one can doubt that all growth depends upon digestion—we know that only about fifty-five per cent. of the food of a healthy animal is digested. What the *average* animal digests we don't know—but Dr. Hess Stock Food will make every cow, steer and hog digest the largest possible amount of food and convert it into profit. If we fed a cow or steer for the same purpose we feed ourselves, they perhaps would not need a tonic continuously. But we make it a business to overfeed the steer, crowding him to an early market, and that's why they should have something to aid digestion.

DR HESS STOCK FOOD ATONIC

the medicinal stock tonic and prescription of Dr. Hess (M.D., D.V.S.) is just what the overfed animal needs. It does not supply additional protein to make bone, muscle, etc., but it does make the food of the farm produce the maximum amount of growth and milk production, besides curing and preventing stock diseases.

Professors Quitman, Winslow, and Finlay Dun, the most noted medical writers of the age, tell us that bitter tones improve digestion, iron makes blood and the nitrates assist nature in expelling poisonous material from the system. These ingredients make up Dr. Hess Stock Food—isn't this pretty strong proof? But besides this every pound is sold on a written guarantee.

100 lbs. $7.00 25 lb. pail $2.00

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal tonic, and this paper is back of the guarantee.

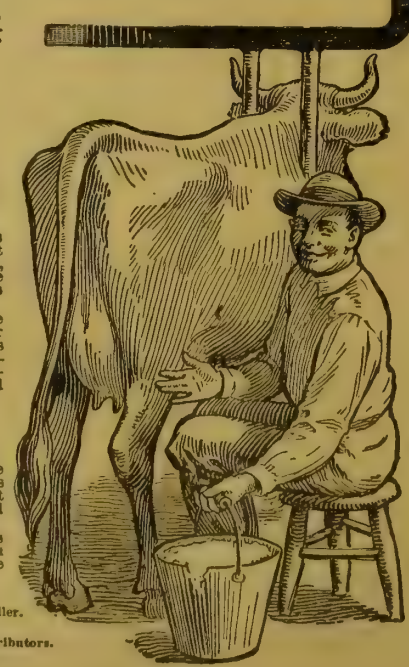
Free from the 1st to 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. You can have his 96 page Veterinary Book free any time for the asking. Mention this paper.

DR. HESS & CLARK, Ashland, Ohio.

Also manufacturers of Dr. Hess Poultry Panacea and Instant Louse Killer.

Instant Louse Killer Kills Lice.

THE PETALUMA INCUBATOR CO., Petaluma, California, Pacific Coast Distributors.



PROPER WAY TO CHURN.

The agitation in churning should be as violent as the form of churn will admit. The churning is to be stopped while the butter is in the granular form. In order to have as thorough churning as possible, the temperature of the cream should not be over 53 degrees.

The buttermilk should be drawn from the churn and the butter washed. The butter must be removed from the churn and salted while yet in the granular form. The amount of salt should be to the taste of the customer. For most people one ounce to the pound is required.

SCOURS IN CALVES.

Take a fresh laid egg, while yet warm, have some one hold the calf's mouth open, then break the warm egg in its mouth. One or two eggs will cure nearly all cases. Five or six eggs cured a bad case in which blood was passed.—"Cultivator Subscriber."

Cock-a-doodle doo! I'm a Checkerboard Chick and these are two friends of mine. See our ad, page 376.

The Vegetable Garden

By ERNEST BRAUNTON

LOCATION OF GARDEN.

THE question of the proximity to the house or other buildings is of great importance when locating the garden. In old homesteads the garden was generally located directly adjacent to the house, requiring but a few steps from the kitchen to reach the extreme parts of the garden.

The work of caring for a garden is usually done at spare times, and for this reason alone the location should be near the dwelling. In case the site chosen for the garden should become unsuitable from any cause it is not a difficult matter to change the location. Many persons prefer to plant the garden in a different location every five or six years.

The lay of the land has considerable influence upon the time that the soil can be worked, and a gentle slope toward the south or southeast is most desirable for the production of early crops. It is an advantage to have protection on the north and northwest by either a hill, a group of trees, evergreen, a hedge, buildings, a tight board fence, or a stone wall to break the force of the wind.

Good natural drainage of the garden area is of prime importance. The land should have sufficient fall to drain off surplus water during heavy rains but the fall should not be so great that the soil will be washed The surface of the garden should not contain depressions in which water will acumulate or stand.

Waste water from surrounding land should not flow toward the garden, and the fall below should be such that there will be no danger of flood water backing up. The garden should not be located along the banks of a creek or stream that will be liable to overflow during the growing season.

A good fence around the garden plot is almost indispensable, and it should be a safeguard against all farm animals, including poultry, and should be close enough to keep out rabbits. A tight board fence will accomplish this result and also serve as a wind-break.

EGGPLANT.

The best soil for eggplant is a warm, sandy loam, well drained, deeply broken and very fertile. The soil cannot well be too rich for this vegetable, and no matter how rich it may be, a generous quantity of manure and fertilizers should be given if the best results are desired. This should be put down broadcast before the plants are transferred to the field.

The seed are sown in hotbeds, and when the third leaf appears are transplanted to other beds, shallow boxes or pots and set 2 inches apart. Before they begin to crowd they are again set further apart and finally transferred to the field.

The eggplant is of tropical origin and very susceptible to cold. From the time the seed are sown until permanent warm weather sets in, a high temperature should be maintained that the plants may not be checked in their growth. The plants are set 3x3 or 3x4 feet if of the large varieties, but 3x2 is sufficient distance for the dwarfs, and even 2x2 is not too close if the dwarfs are not to be used after the standard varieties begin to fruit .

Cultivation should be shallow, frequent and continued as long as the plants will admit of the passage of the plow between the rows. A top dressing of nitrate of soda and muriate of potash applied when the first fruits are forming will be of marked benefit.

Eggplants are gathered for market when from 2 to 4 inches in diameter by cutting the stem with a strong, sharp knife. They are shipped in barrels or barrel crates, each package containing fruits of uniform size.

The New York Purple and Black Pekin are the standard market varieties. The Early Round or Oval are from two to three weeks earlier than the first named varieties; the first is very small, however, and practically worthless when the large varieties come in bearing.

SALSIFY OR OYSTER PLANT.

This vegetable, though planted by few, is not only a delicious but an important one for the home garden. It is available for cooking from early fall until late spring, through a period when there is the greatest scarcity of vegetables.

Salsify requires a deep, rich soil that has been well manured the year previous. Sandy loam is best, though it will grow on the majority of soils, if they are fertil and well prepared. Coarse or fresh manures must be avoided, as they have a tendency to make the roots fork and scar.

Prepare the soil 8 to 12 inches deep, and make it as near as possible the same texture and fertility throughout. The seed are sown thickly in narrow drills 1 to 2 feet apart, and plants left 1 to 2 inches in the drill, or even closer, if the soil is very fertile.

Missing places may be filled by transplanting. The seed should be sown quite early in the spring, and the ground kept free from weeds by frequent cultivation. Salsify is one of the most hardy of vegetables and is rarely winter killed. When it is thought necessary to protect it, two furrows with turning plow may be thrown on the rows in December, or the plants may be taken up and stored thickly in trenches. In the southern portions of the state no winter protection is necessary.

When cooked the flavor of salsify is very suggestive of the oyster, hence its name oyster plant or vegetable oyster. In cooking salsify the roots are first boiled, when they may be sliced and fried, or stewed or made into soup after the manner of cooking fresh oysters.

PREPARATION OF SOIL.

Where there is considerable choice in the location of the garden plot, it is often possible to select land that will require very little special preparation. On the other hand, it may be necessary to take an undesirable soil and bring it into suitable condition, and it is generally surprising to note the change that can be wrought in a single season.

Heads of great men all remind us,
If we go the proper gait.
We may get up of a morning
With a head that's just as great.

Roofing Troubles! End them with Congo. Leave the old roof there and just lay Congo Roofing over it. It won't cost much; it won't take long.

Everybody who tries Congo likes it the first year, likes it better the second year, is proud of it the third year and gets more enthusiastic after that the longer he waits for it to wear out.

A sample is pretty good evidence. We will send you one free. Ask for it

CHAS. C. NAVLET CO.'S BUG PROOF SQUASH—THE SQUASH OF THE CENTURY

THIS is unquestionably the grandest Squash on Earth. It grows strongly and rapidly. It defies the attacks of bugs. It produces colossal crops. It keeps in perfect condition for a whole year. The fruits—of oblong shape—have very rough—and very hard shells, and weigh about 40 pounds each on an average. The flesh is a rich yellow in color, very thick, fine grained, sweet, dry and of surpassing flavor either roasted, boiled, steamed, baked or in pies. It is also one of the finest Squashes for feeding to the stock. We are sure that those who planted Bug Proof Squash this season, whether for family use or market, will appreciate its unequalled merits as thoroughly as we do. Per packet 10 cents—quarter pound 35 cents, half pound 60 cents, pound $1.00 Post paid

Send for our profusely illustrated Bargain Catalogue of FloweringPlants. Seeds, Berry Plants and Fruit Trees.—Its Free.

We sell all varieties of Vegetable Seeds (except Bug Proof Squash) at 3c per packet, and with each fifty cents' worth ordered will give free one packet each of Countess Spencer and Helen Pierce—the two prettiest Sweet Peas yet introduced.

Chas. C. Navlet Co. The Lowest Priced Seed House in California San Jose, Cal.

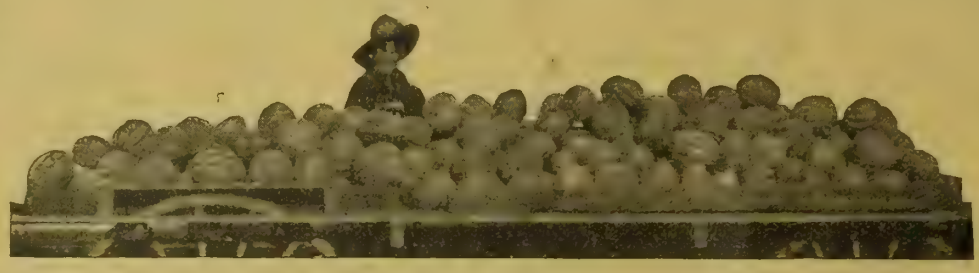
Hurrah for me! I am a Checkerboard Chick. See my ad, page 376.

The New Melon

HAS BEEN NAMED THE

J. & M. Christmas Melon

By Charles Richardson, of San Gabriel, Cal., who was awarded the $5.00 offered by Johnson & Musser Seed Co. for the best name for the New Melon. **Price—Per oz., $2; per pkt., 50c.** Sold only by Johnson & Musser Seed Co.



The Most Popular Musk Melon on the Los Angeles Market. For Two Years

Gautier's Pineapple Musk Melon

Has eclipsed all other varieties to such an extent that ninety per cent of all the musk melons grown for the Los Angeles market are of this variety. **Price per lb., $1.00.** Sold only by Johnson & Musser Seed Co.

Oregon Evergreen Sweet Corn

Last year was the first season this excellent sweet corn was grown extensively for the market, with the result that the newspapers commented upon the unusual excellence of the sweet corn offered by the peddlars. No market gardener will now grow any other variety because Oregon Evergreen Sweet Corn will yield nearly double the crop of any other variety, is less liable to the ravages of the worm and, once having tasted this, the consumer will have no other. **Price—Per lb., 15c; per 100 lbs., $8.00.** Sold only by Johnson & Musser Seed Co.

Eastern Grown Field Corn

We have just received our usual carload of seed corn from Nebraska. It is extra selected and hand-picked. Send for samples of the varieties you wish to plant. Why plant common seed when 25c worth of our extra selected hand-picked Eastern corn will plant one acre. **Price—Per lb., 5c; per 100 lbs., $3.50.** When ordering corn seed to be sent by mail, add ten cents per pound for postage.

The Up-To-Date Seed House

Johnson & Musser Seed Co.

113 No. Main St., Los Angeles, Cal.

Anaheim Chili

Nearly ten inches long

In this chili Southern California should feel a personal pride. It is of local origin, and as we are always on the lookout for the best of everything we discovered this excellent pepper, already popular in the Anaheim section, but little known elsewhere. We now buy the peppers and take the seed from them, so we are enabled to positively guarantee our seed true to name and the best of its kind. **Price—Per kpt., 5c; oz., 25c; per lb., $2.50.** Sold only by Johnson & Musser Seed Co.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The **only** way to **Irrigate Alfalfa. Cheaper** than **Flumes.** This is only **one** of our **specialties.** We make **Riveted Water Pipe** in lengths of **ten feet** from **single sheets.** Let us **prove** to you that we make **Pipe** and **Tanks right.** WRITE FOR CATALOGUE.

TALLERDAY MANUFACTURING CO.

636-7 Pacific Electric Building **Los Angeles, Cal.**

MELON LEAF-BLIGHT.

Fungus is the usual cause of leaf-blight of musk-melons or cantaloupes throughout the country, though downy mildew and anthracnose also occur and sometimes are associated with the leaf-blight.

Leaf-blight begins in small, round spots, which usually show faint concentric rings. These spots enlarge and their effect is very quickly visible on the leaf. The cantaloupe leaf in particular, owing to its thin and delicate structure, will curl at the margins and shrivel up in a few days.

The disease is caused by a fungus closely related to the species causing early blight of potato, leaf-blight of cabbage, etc. It was first studied in this country by Dr. Erwin F. Smith in 1892. The same year it was described from Italy as Alternaria brassiacae, var. nigrescens. Later the same fungus was named Macrosporium; and has been referred to under this name in several experiment station bulletins.

Leaf-blight is spread by spores borne on the upper side of the leaves and carried by the wind and the other usual agents. No perfect stage has been discovered, but it is probable that the fungus lives over winter in the fields, and the experience of farmers indicates that it is worse on fields repeatedly planted in melons. Rotation of crops is therefore advisible to lessen its ravages. This disease does not, as a rule, develop in the field as rapidly as the downy mildew, but in warm, humid weather it spreads quickly and does great harm. The ripening of the melons is hastened, their quality greatly injured, and the total crop diminished.

GARDEN INSECTS.

Some insects are considered more or less spasmodic or sporadic in the nature of their attack and injurious only in seasons which have been unusually favorable to their increase.

A certain proportion of these are for this reason of secondary importance, economically speaking, since in ordinary years of comparative scarcity they find nutriment sufficient for their needs in various wild plants and weeds, being driven to attack cultivated or other useful plants only in their seasons of greatest abundance.

Some few of these are as yet comparatively little known, having done no material damage, but several are increasing in noxiousness, and those which have never assumed great importance are liable to become so at any time, at least periodically or locally. Certain of the species, however, are of the highest economic importance when they occur in excessive numbers, and two of these, the destructive green pea louse and the fall army worm, have been among the most troublesome pests of the past year.

FREE SEED.

The whole custom is a graft, pure and simple. Everyone knows that if it was not for political effect the government long ago would have discontinued this appropriation.

The whole custom is based upon the false assumption that the farmers can be influenced by a few seeds distributed by the government, and the farmers themselves have answered this time and time again by taking emphatic position against this form of graft.

There is no farmer in the country who does not see clearly through this vote-getting scheme. The seed-getting game has played out, and the money could be used much more advantageously by giving it to agricultural schools and good roads.

What's the use? We have told our representatives in congress, time and time again, that we didn't want free seeds. We have denounced it as a graft, but they keep coming just the same. If my congressman sends me any free seeds I'm going to return them by express collect. If all who are tired of the free seed graft will do likewise we can stop it.—E. B.

Is it Purina Chick Food? It must be, it looks so clean and nice. I'm a Checkerboard Chick. See my ad, page 376.

With the Citrus Growers

By J. W. MILLS

THE USE OF GYPSUM.

AN ORANGE grower wishes us to explain the use of gypsum, if it is beneficial to orange trees.

This would depend on circumstances, if it is good for them under any condition. We do not know that it is at all. One use of gypsum in agriculture, is where it fixes nitrogen that is passing off in the shape of gas. Added to the bedding in the stable, it lays all the bad odors which are nothing more than free nitrogen gas in combination with different ferments. Gypsum, which is sulphate of calcium, the base of lime.

Ammonia has a strong affinity for sulphur and robs the calcium of it on sight. It immediately becomes sulphate of ammonia, which is a solid, while the calcium takes up with other gases and is lost sight of in a practical sense. When the manure is piled out in the weather, part of the sulphate of ammonia is washed out by rains as it is soluble in water to a certain extent and so part of it becomes lost. If thrown out in the field or orchard where it is to be plowed under, it will be partly taken up by the soil. Part of the ammonia that takes the form of sulphate from gypsum, will assume other forms in the presence of lime and just what results perhaps no one knows. Here is one use of gypsum. Other uses are not so important to orange growers.

The most important use of gypsum, from an agricultural standpoint, is in converting "black alkali" into "white alkali." Black alkali is carbonate of soda and white alkali is sulphate of soda. The former is corrosive, and most economic plants are fatally injured by its action, especially at the time of germination of the seed. This will be discussed later.

When gypsum, "sulphate of lime," comes in contact with black alkali (carbonate of soda) a chemical change takes place, if water is present. The result is carbonate of lime, which is nothing more than marble dust, which is perfectly harmless and sulphate of soda or white alkali. When chemically pure, both these alkalies are white. The carbonate is called "black" because it dissolves the humus in the soil and takes it along with it in the drainage water. The sulphate of soda does not do so.

It is thus seen that there is a great advantage in applying gypsum when the black alkali is present. It saves the humus that is so valuable to the soil. When the humus goes off into the country drainage, the loss is great. Another advantage is gained in using gypsum. Black alkali packs the soil by cementing it, making it almost impervious to water. It is very difficult to leach it out of the soil, except when a large head of water is rushed over the surface. This takes off a small percentage, but the greater part penetrates the soil only to rise with the water and remain on the surface when evaporation takes place.

Where there is a large percentage of this form of alkali, ordinary rains will not leach it out. With the white alkali it is different. It permits the soil to remain porus and thus it can be drained easily. However, it is useless to enter into a system of drainage, unless there is co-operation among those in the alkali district. The drainage from above will supply the land below with the salt. When there is no suitable delivery for the drainage water, it is of no use to try to free the land of these salts. Soaking the soil without drainage will only carry it a short distance below the surface from whence it will return when evaporation commences.

The most economical way to handle such land is to keep the surface well stirred after each rain, thus shutting off capillary action and stopping the evaporation. This keeps the alkali evenly distributed and thus its deleterious action on the roots is reduced. The deeper this distribution is, the less active it will be. Repeated surface irrigations will wash the alkali down from the surface and very often plants which are very sensitive to it will make a good start, and if good cultivation is continued good crops will be obtained.

Land that is even slightly alkaline is not good for oranges. The orange is soon destroyed by an amount of alkali that will not affect grain. Unless the alkali is admitted to the land in the irrigation water, alkali land is of no value for orange growing as such land is usually in low situations subject to severe frosts. Occasionally, however, an alkali deposit lies in a ledge above choice alkali land. The drainage in such cases is usually so good that it does not concentrate in any area close to suitable citrus situations.

THE ORANGE.

The orange is king of the citrus fruits. It may be treated as a type representing the other members of the group in many particulars relating to soils and cultural methods. In some respects special treatment is required for lemons, limes and pomelos, as described in the sections devoted to these fruits.

The orange will grow successfully in a great variety of soils, yet there are a few essential characteristics of a good orange soil which cannot be overlooked with safety by the prospective grower. The soil must be abundantly moist, but must allow good drainage. It should be deep and rich. It is best to avoid the extremes of heavy and loose texture, though some very heavy soils have been given excellent results, particularly when overlaid by a stratum of lighter character. Shallow soils and those underlaid with hardpan near the surface are unsuited to orange culture.

The orange makes very indifferent success of the "hole-in-the-grass" method of cultivation. Where the space is too limited to admit of anything like orchard cultivation the orange will often grow and produce fair fruit, but if a serious attempt is made to grow more than one or two trees they should be placed where their rights to full possession of the soil immediately surrounding them will not be disputed by grass, weeds or other trees. The first step, then, in preparation is to clear the land, if it be occupied by any other trees. If the soil be virgin it would be well to plant some other crop for a year or two, plowing it deeply and keeping it in good tilth. It is important that the soil be worked deeply, for otherwise the trees, when set out, are likely to form surface rather than deep-feeding roots. Surface-rooted plants suffer much from dry weather. Plow deeply, harrow thoroughly, and get the ground in as friable a condition as possible.

CITRUS FRUITS IN HAWAII.

Citrus fruits were introduced into Hawaii more than a century ago. In the record of Vancouver's voyages it is recorded that in the year 1792 that explorer gave to one of the Hawaiian chiefs in Kona "some vine and orange plants" besides other valuable plants and seeds. A few days later "some orange and lemon plants that were in a flourishing state" were landed on the island of Niihau.

These oranges were probably from Tahitian seed, since Vancouver sailed from Tahiti to these islands and records having received large supplies from the natives before his departure. Even earlier attempts at the introduction of the orange and the lime are reported, but it is difficult to say which of the efforts was first successful. Some of the oldest orange trees in the islands are said to have been in a flourishing condition a few years ago at the residence of the late Thomas Brown, Esq., on Kauai.

Oranges, lemons, limes and pomelos have all found a congenial home in Hawaii. Indeed, the orange is sometimes thought of by the casual observer as being indigenous, so eminently suitable have the soil and climate proved to be.

When properly cared for and fertilized some of the native orange trees produce fruits unexcelled in point of flavor and juiciness, bearing little resemblance to the very indifferent specimens often found in the markets, which have been picked green, dumped into casks without curing, and sent into the market.

Good Natured Tools

It is not necessary to *force* Keen Kutter Tools. Keen Kutter bits, for example, work quickly and easily in any kind of wood. Lips are long, strong and perfectly tempered, adding years to the life of the tool.

Keen Kutter Tools like hard work. The edged tools never lose their temper—handled tools never work loose or fly off—hammered tools keep their faces straight.

AN AGRICULTURAL PROBLEM.

Before this issue of the Cultivator reaches its readers one of the most serious problems, in labor, which has arisen in recent years, will have been settled for weal or woe. Fifty thousand employers of forty great railroad lines, covering ninety-five thousand miles of track and an annual pay-roll of three hundred and twenty million dollars, have threatened to strike unless their demands for an increase of wages and shorter hours are granted by the managers of the lines affected.

The managers of these lines say that they cannot grant the demands and there the matter rests —at this writing. The requests of the employees may, in part, be just. They have some color of truth in their averment, but the railroad managers say they cannot concede them because of the recent attacks on the railroads by the government, which has destroyed public confidence in railroad stocks as an investment.

As a general thing, the employees of the railroads in this country are white men, they are above the ordinary class of workmen in intelligence and trustworthiness, and are naturally desirous of bettering their condition. They are to be commended for this endeavor. But the question is, how far can they go in their demand without paralyizing the industrial conditions of the country?

Theoretically, at least, the releasing of an army of operatives should be the farmers' opportunity to obtain help easily and perhaps cheaply. As an offset, however, comes the probability of lower prices for the necessities of life-farm products. Deprive the laborer of his daily pay, and it is quite beyond possibility that he will continue to consume as he had been doing under better pay. With his purchasing power obliterated, or greatly curtailed, he has no alternative but to satisfy the barest claims of hunger; and conversely the market for farm products would then be over-stocked, glutted, and prices, following natural laws, would drop. Gen. Benjamin F. Butler, in his campaign for presidental honors, credited low prices of land produce, not to over-production, but to under-consumption, his idea being there could never be too much produced, but there might be too little consumed. It can readily be seen that the tying-up of fifty thousand men would mean a reduction in the volumn of consumption, which would affect the market all over the country. Let alone the losses, the farmer would incur by reason of his inability to ship his produce to market, he would suffer incalcuable loss by the general stagnation of trade and the failure of the employees, out of business, to purchase commodities of life as of old. We sincerely trust there may be no long-lived strikes in the transportation industry of this country for years to come, because of their widespread deleterious influence on the financial conditions of the nation.

WHAT SHALL THE HARVEST BE?

Tens of thousands of farmers and fruit growers throughout the state of California, are turning anxious eyes toward the earth at this season in anticipation as to what is to be the reward for their labors. As the grain grower views his vast fields of wheat, oats and barley, he gazes earnestly at the growing crops very much alert and mind busy with the expectations and hopes of the coming harvest. But beyond this plowing farmer there stands countless thousands whose feet have never trod plowed land, and they, too, watch the farmers' exertions. "What if his efforts fail?

In some portions of the country his hopes have been dampened from the almost too copious rainfall, and he is anxious lest the harvest shall not return him the bounty promised in the earlier days.

The fruit grower walks among his trees very much alive to the somewhat doubtful outlook that confronts him in the transportation of his crops later on. He feels assured of a bountiful harvest, but is not so sure how he can get that harvest to the markets of the world. In the meantime the business men of the country, from their counting rooms, are taking note of crop conditions, well knowing that the commerce of the nation, its financial institutions, its colleges and universities, its law courts and its churches exist because the man in the agricultural field wrings success from the land. He, alone, among all who tread the globe has power, knows the art of turning dead soil into living crops. Let the waiting thousands who are fed by the farmers' bountiful stores pay willing tribute to his skill. The men who feed and clothe the nations of the earth deserve to be, and must be, more than mere slaves of the soil. They are, as they should be, the kings of the earth.

COST OF CEREAL FOODS.

A correspondent writes asking why cereal foods—breakfast cereals—are so high when the grains from which they are produced are sold so low. He cites wheat in the eastern market at a round dollar per bushel, oats at thirty cents, etc., down the list of grains used in the preparation of cereal foods.

Probably the answer to the question, in the major part, at least, will be found in the cost of putting them on the market and advertising these kitchen commodities.

The extension of the industry has made popular the package idea of kitchens. American housewives take kindly to pasteboard cartons. The sudden growth would have been impossible without cartons. Small pasteboard boxes and large wooden cases, each holding two or three dozen cartons, are very large items in the cost of production, but labor-saving machinery cuts these items down to a minimum. In the food factories the cartons are cut, printed and folded almost automatically; and after they have been automatically filled with cereal food, they are closed with paste by machinery. Only by machinery has it been possible to keep the cartons' cost under a cent a piece. One Chicago factory spends more than $5000 a day on cartons, while another spends considerably more.

In putting a carton of a certain well-known breakfast food on the market, the cost of the cereal product is about 2 1-3 cents, making the cost of manufacture 3 2-3 cents. The selling price to the grocer is 11 1-3 cents, and to the public 15 to 20 cents. One factory uses a piece of paraffine paper to wrap the product inside the carton. This paper costs more than $100,000 a year, but the manufacturers think that American housewives want to have it, and the sale of this particular product would seem to indicate that they are right.

The profit in the sale of cereal foods is large but a market is not to be had for simply the asking. A market can be created and kept in existence only by persistent publicity. It costs from $400 to $800 in advertising to sell $1000 worth of breakfast foods. The man who makes wheat-coffee spent, a year ago, $884,000 in advertising in 800 newspapers and 30 magazines, and this year he will spend a million dollars or more.

The makers of Shredded Wheat spend $700,000 a year in advertising. Another manufacturer $250,000, and the cost of this publicity is, of course, attached to the purchase price of the cereal. So all along the line, and it is this publicity expense, and the carton cost, which figure in the price of our breakfast foods.

We may be inconvenienced somewhat by the copious rains of the season, but think what a reward will come when the crops are garnered. Rain and mud are unpleasant when too predominant, but they are necessary and, therefore, to be endured for the sake of future comfort. The railroads are the worst sufferers, but then their temporary inconvenience and expense in repairs is made up a hundred-fold when the crops go out.

A good farmer will make a good farm of the poorest farm in a township. There is nothing so fine for a poor farm as a fine farmer.

California is taxed heavily by the railroads, but then where would California be without them.

Wright's Green Meadow Dairy
Established 1861

AUCTION
300 Cows and Heifers

Wednesday, April 17, 1907

One Mile West of Watts
Three Miles South of Ascot Park

Sale Begins Promptly at 9:30 A.M.

THIS is without exception one of the finest Dairy Herds in Southern California.

The bulls at head of this herd are **Thoroughbred Registered** and the cows are all selected dairy stock.

200 Cows milking at the present time. Many are exceptionally heavy producers — milking 60 pounds and over per day.

TERMS:

Six Months Time on Approved Note
Liberal Discount for Cash

Old-Time Spanish Barbecue — Free

Teams will meet Pacific Electric Cars at Watts Station

On account of the large amount of stock to be sold, the sale will begin promptly at 9:30 A. M.

COME EARLY.

All will be sold without limit or reserve, as owners are retiring from the dairy business.

Reed & Bennett

555-557 South Los Angeles Street

No Outside Stock Will Be Sold at This Sale

News Notes of the Coast

Southern California

Cantaloupe vines at Brawley are in bloom.

Orange has had 18.47 inches of moisture.

Saticoy has had 28 inches of rain; Ventura 28.51.

At Rialto it has been damp to the extent of over twenty inches.

Ontario reports a large number of orange grove sales the past week.

Highlands has received more than 20 inches of rain. So has Banning.

San Jacinto and Hemet have had over a foot and a half of rainfall.

This last time Fairmont got .92 inches, making a seasonal rainfall of 27.83.

Chino's rainfall by the last storm was 1.47 making 25.78 for the season. Last season to date it was 19.55.

There should be plenty of peanuts in Coachella valley this year as a great many ranchmen are going to put in a few.

Between forty and fifty boxes of asparagus are being shipped daily by express from Fullerton to the eastern markets.

The express shipments from Escondido for the week were 294 cases of eggs, 3355 pounds of cream, 775 pounds chickens.

Thursday, Friday and Saturday of this week the second annual flower show of the Pasadena Gardeners' Association will be held.

The Tri-Counties Reforestation Committee met at Riverside Monday afternoon at 1:30 o'clock, April 1st to devise ways to replant our watersheds.

To date 1785 cars of oranges have gone forward from Redlands this season. This is just 300 less than had gone forward last season at this time.

Redlands reports 21.47 inches of rain for the season, and San Bernardino goes that a little better with a total of 22.61. Riverside has had 15.76.

D. Bastanchury has made the first shipment of spring lambs from Orange county, sending two carloads to Los Angeles. The shipment netted him $1500.

Lumber is arriving for the new shipping shed of Brawley Fruit Growers' Association. Two sheds will be built, one 310 feet and the other 150 feet in length.

The San Joaquin Fruit Company of Tustin has started on the planting of 140 acres to lemons and oranges. This work will keep a force busy for several weeks.

Nurserymen at Whittier report that they are unable to keep up with the demand for budded walnut stock, and are preparing for an equally big demand another season.

The first pre-cooled car ever sent East from the Pacific Coast left Riverside over the Santa Fe for Chicago, yesterday, filled with oranges from La Mesa packing-house.

Five Riverside boys were fined $25 each with the alternative of a twenty-five-day jail sentence, as the penalty of snowballing last week. Snow is so unusual at Riverside that $25 is cheap for the fun.

The citrus fruit in Southern California which has not yet been picked is in better condition than it would usually have been at this season. The cold weather and continued rains have kept it firm and sound.

The San Jacinto markets quote alfalfa hay at $12 per ton; eggs, 18 cents per dozen; creamery butter, 75 cents per roll; ranch butter, 50 cents per roll; cottonwood brings $5.50 per cord and hardwood, $8.50 per cord.

The downpour during the late storm at Fullerton was 2.25 inches, exactly the same as was the precipitation on the same dates last year. This section has had this season 22.66 inches, against 17.32 at this time last year.

The apricot people about Tustin are feeling very blue on account of the dismal outlook for this fruit, the last two storms having practically ruined the apricots. This is quite a serious loss, as the apricot crop return is always a fine "filler" and it will be missed this year.

Northern California

The Cupertino section has had about 30 inches of rain.

Tulare has had 15.14 inches of rain as against 14.30 to same date last year.

A large sale of wine involving over 100,000 gallons is reported from the Windsor section.

Since January 1st Lindsay has shipped 60 cars of oranges.

W. L. Knoop and Edward Krull of Live Oak lost several thousand sheep during the recent overflow.

The Navarro river was 6 feet higher last week than the oldest inhabitant can remember ever seeing it.

Cattle owners of Amador county met in Jackson last Thursday and formed a cattlemen's association.

Pork on foot is commanding the fancy price of eight cents a pound in the Exeter section at the present time.

The Registered Holstein-Friesian bull Glenbrook De Kol was sold by R. F. Guerin to E. O. Larkins, Visalia.

The Western Creameries Company paid out for cream in Dixon for the month of February the sum of $1,014.09.

The flood did great damage in Oroville and several people were drowned. The water was six feet deep in the streets.

A man near Wheatland by the name of Johnson lost 20,000 head of sheep on the Weaver creek divide during the storm.

Information has been received from Capay valley to the effect that both almonds and apricots have been badly pinched by frosts.

Owing to the flood there is a scarcity of hen fruit and butter in Marysville, and merchants are limiting the quantity sold to one family.

Reports come from the Winters fruit belt that vines have not been injured in any part of the county, but the grape crop will be later than usual.

Dispatches state that 16,000 tons of barley stored in Stockton warehouses have been badly damaged and some of it destroyed by the floods that soaked the grain.

Some of the young beets about Corcoran are already up, and the prospects are for a fine crop. The beets will be shipped to the sugar factory at Visalia.

A great many hop poles about Healsburgh were washed away, but it is not thought that any serious loss has been sustained on account of washing away of the land.

Reports from many hop fields of Sonoma county which were inundated by the great floods are to the effect that many acres of poles have been washed out.

Manager Porter of the Grass Valley Produce company lost 1000 chickens, four head of cattle and a large quantity of feed at his ranch in Sutter county by the floods.

H. S. Weams, a prominent bee man from Wasco, was in Tulare and purchased 200 hives of bees. He will ship them to Ramosa, where he has now about 2000 hives.

Reclamation district No. 208, west of Grimes went out on Saturday afternoon. About 25,000 acres of farming lands are flooded and the prospects for crops this year are poor.

W. E. Perry, of Corning, recently placed 102 eggs in an incubator, and this week 101 lively little chicks greeted him. There was not a cripple in the bunch. Who can equal this?

There are eight breaks in district No. 70 and the stock loss is heavy. The water came over the long bridge on the road between Sutter City and Meridan, and the structure is wrecked.

The Hanford Sentinel is authority for the statement that the wheat barley is growing so rank over in the Mill Creek country that the farmers are compelled to mow or pasture it to check its growth.

L. S. Cnittenden reports great activity in the planting of sugar beets at Corcoran and states that there are a number of teams engaged east of the town plowing and putting in about 1000 acres of the vegetables.

Richest Farm Lands In California

Are those found in Kings and Tulare Counties, where sugar beets, alfalfa and fruit return immense profits.

Dairying

proves highly remunerative and stock raising is better than banking. These lands are selling for $25 to $30 per acre. Profits follow improvements. Over $1,500,000 invested on lands owned, sold and developed by this Company.

Corcoran

The center of this tract of wealth, is a magic town, provided with every advantage of railroads, water and electric lights, and is a marvel for its age.

Chicks Just Hatched We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.
Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.
CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

Altadena Buff Orpingtons
N. HAYDEN & CO., BOX 1001, PASADENA
You can win with my stock and eggs because I have won and am winning. Matings this year very fine. Inspection invited Write me your wants. Eggs $2, $3 and $5 per 15.

It isn't what an **Incubator Did**
It's what an **Incubator Does**

Suppose you invest in an incubator, fill it with expensive eggs, waste time and bother on it and find the eggs don't hatch?

It wouldn't be much satisfaction to you to know that the incubator had given big results to some one else.

Buy a Glendale Incubator and Brooder

and get the maximum results yourself. They are not complicated like many others, and for that reason there is practically no chance to make a mistake. Everybody has the same splendid success with Glendales. The "Glendales" do their work automatically and thoroughly.

Glendale Incubators and Brooders cost less than any other first class machines. They are revolutionizing poultry raising.

The 120-egg size $22; 240-egg size $32; 360-egg size $42; 500-egg size $52.

We want you to attend a free demonstration now being conducted. If this is not convenient, write for catalogue.

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

HATCHING HATCHABLE EGGS.

THE brighest and best thing in chick culture is (says Poultry Husbandry) that many men and women are thinking about fowls and how to manage them for the best results. Thousands of people are studying and working on poultry problems. The calling is advancing and its progress during the coming years will show many striking improvements and developments.

"Live and learn," is a favorite proverb with me. We can learn, not only by our own experiences, but by the experiences, losses and failures of others.

Unsatisfactory Hatch.

"Can you tell me," writes an enquirer this week, "why my eggs do not hatch?"

He is hatching less than twenty-five per cent. of the eggs that he is putting into his incubator. It seems to him that instead of having a sure hatch that his incubator is sure not to hatch; he writes to me for help. He is not the only one by any means in trouble and in answering him I help others.

There are many reasons for eggs not hatching as I have already mentioned. Of course the first of these is infertility of the egg. To have fertile eggs is the first consideration. Fertility can only be attained by having vigorous and healthy fowls. Fowls that are fed for fertility.

Feeding for Fertility.

How do you feed for fertility? Consult Nature! Nature feeds her wild fowls in the Spring, the only time when they need fertile eggs, with tender, green grass and leaves and with an abundance of animal food. For in the springtime grubs and bugs, which have lain dormant during the winter are coming to the surface to commence to propagate and ravage the flowers and fruits.

There are but few grains in the spring and most of those are sprouting. Imitate Nature if you want healthy and strong fertility. Give plenty of green food and a liberal supply of meat or something that is equivalent. You may possibly by neglecting this get some few fertile, but rarely hatchable eggs (note the difference), for it is hatchable eggs we all want at this time of year.

Hatchable Eggs.

To illustrate what I mean by hatchable eggs; a case of eggs was sent to the "Gardena Hatchery" to be hatched. The expert owner and manager refused to accept them. "Those eggs are not hatchable," he said. They were thin, pointed eggs, "narrow waisted," with too little "protein" in them and the expert knew by experience that such eggs would not hatch and that there was no use trying to hatch them.

The owner of the eggs admitted he hand not been able to have a good hatch this year, but did not know the cause of it. What could he do? Sell those eggs for market purposes and go home, feed his fowls more protein, a better balanced ration for fertility, that would be more meat and all the green food that the hens wanted.

Feed your fowls for fertility, have them clean from lice, vigorous and healthy, give them penty of grit to grind the food and make the egg shell, and then choose the eggs that are plump and well shaped, with good, smooth shells. Examine them through your egg tester, or if you do not have one, take a roll of paper or a roll of music; hold the egg at one end and your eye at the other.

If the egg is in a bright light, like the sunshine, you will be surprised at what you can see. Reject all eggs for hatching that have thin shells, or those with thin places or such as are freckled all over with thin spots. These will only not hatch, but they will be cold and will draw from the vitality of the eggs that may lie next to them in the tray; they are detrimental to the rest of the hatch.

I know too well the disappointment of filling an incubator with eggs, tending them most carefully for twenty-one days and at the end carrying out a bucketful of eggs for burial. I can sympathize with our enquirer and I have learnt to take as few risks as possible.

Lessons Learned.

Some lessons that I have learnt are: First, to have healthy parent birds; secondly, to feed for fertility, giving a plentiful supply of grit, charcoal and oyster shell; of these grit is the most essential. If I cannot get crushed oyster shell, I mix lime in water about as thick as pancake batter, let it stand twenty-four hours and then pour it on the ground, about a pint in each yard; it soon dries like a big pancake and every day I crush a bit off it for the hens to eat. This will make firm egg shells.

After my fertile eggs are laid I gather them twice a day or oftener. I never leave them in the nests for the other hens to use as nest eggs, it may start the germ to growing with baneful consequences. I keep the eggs in a moderately cool, dark, quiet place, never in a draft and I never keep them over two weeks, for I want to be sure of a good, strong hatch and the fresher the egg the better the hatch.

I have written so much about properly incubating eggs in the last year that I will not add more to it, but will only say a few words in reply to our enquirer's question. "Why do I have so many chicks dead in the shells?"

Chicks Dying in Shell.

All who have studied the important matter of why chicks die in the shell have their own theories on the subject, so I may be allowed mine. There are two principal causes for this mortality. First, insufficient or faulty ventilation and secondly irregular-

When writing advertisers mention Cultivator

ity of heat. Years of study and experimenting have convinced me of this.

In some incubators there is scarcely any ventilation, there may be a ventilator or hole somewhere, but does it ventilate? Does it exclude the carbon dioxide, that poisonous gas that the eggs throw off? Does it admit the pure oxygen so necessary to the life and health of the embryo in the egg?

At one time I was operating three different makes of incubators, all had so-called ventilators, holes at the top or at the bottom or sides, but I could not discover any circulation of air and after many trials I decided that the only way to succeed in getting good hatches was to air both the incubator and the eggs thoroughly and frequently. I therefore aired and turned the eggs three times a day and at the same time I fanned the stale air, the carbon dioxide, out of the incubator. The result was a 99 per cent. hatch, which confirmed my theory.

Extreme Measures.

The expert whom I have already mentioned told me that last year a lady he knew was having very poor hatches, she had the same incubator that our enquirer is using; he advised her to leave her eggs out of the machine for two hours every day, putting them into the sun. She had been having such poor hatches that she felt desperate and was ready to try anything. She followed his advice and had a fine hatch.

I have had hens that sat too closely on their eggs and had chicks dead in the shell or cripples. I know this is rare. I have had hens that would remain upon the nest forty-eight hours or more; those hens invariably had poor hatches, whilst the hens that would stay off the eggs long enough to cause me anxiety had excellent hatches.

One cause, therefore, of the poor hatches is, I believe, faulty or too little ventilation. Faulty ventilation would include too strong or swift a circulation of air in the incubator; this would dry out the egg too much and weaken the chick. I would rather have insufficient ventilation and trust to airing the eggs myself, than have the eggs in a draft.

Equable Temperature Necessary.

Irregularity of heat in the incubator kills many embryo chicks and towards the end of the period of incubation it cripples many. In operating an incubator, remember that 106 degrees is danger point during the first week; also that after removing the infertile eggs or the dead germs, the thermometer must be closely watched, for there will be a rise in the temperature and the regulator will probably have to be adjusted. During the last week of incubation too high a temperature continued for some time will invariably result in cripples, or sprawlers.

"I had no cripples in my last hatch," writes a friend.

That is good, that shows that the temperature was right and that the chickens were well hatched. A well hatched chicken is one whose digestive organs, whose heart, lungs and liver have not been over-taxed during incubation, have neither been chilled nor over-heated and consequently are in a healthy and vigorous condition, ready to commence life with good prospects of success.

Irregularity of heat is frequently caused by inferior oil in the heating lamp. Get the best oil that you can buy. The best is none too good and the life of one or two chickens would more than pay the difference in the price of good or bad oil.

Breeding.

Would it be good to use a cockerel in my breeding pen that has any colored feathers. He is a White Wyandotte.—J. F. Y.

If you are breeding for exhibition stock it would be better to use a pure white male. It is always best to keep to the Standard.—Mrs. A. B.

Of course I feel good for I'm a Checkerboard Chick.

What a Noted Poultryman Says:

"I would rather have a POOR bird well fed than a GOOD bird poorly fed, but take a good bird and feed it PURINA FEED and you're bound to build a winner every time."

Now, there's a reason for this. And the reason is that only the BEST grain and other ingredients go into PURINA POULTRY FEEDS, which are balanced scientifically for the building of frame, feathers and eggs.

THE CHECKERBOARD BRAND

Stands for the Best in Poultry Feeds

You will always find PURINA POULTRY FEEDS put up in CHECKERBOARD BAGS so that you can't mistake them, and in the Checkerboard Bag you'll find the best Feeds on the market. They're made by the Purina Mills, by the people who KNOW HOW from experience. Don't take inferior feeds when you can get the best.

A Perfect Feed for Every Purpose: Purina Baby Chick Feed saves the little chicks; Purina Egg Food makes hens lay; Purina Scratch Feed has the largest variety of the best seeds, properly proportioned.

Ask your dealer for THE CHECKERBOARD BAG and insist on having it. Take no substitute. Don't let anybody make you think something else is just as good. If your dealer doesn't handle our feeds, then send us his name and we will send you samples and a copy of the "Feed on the Purina System."

our friend shows for the welfare o his flocks.

He is really untiring in his devotion to their well being and in return fo this watchful care has been rewarde by his fowls capturing long strings o prizes, because they felt so good the just had to look their best, not only their best, but the best in the show.

Last year Mr. Harley won 30 prize on 30 entries. This year he won 6 prizes, including 27 first and 20 second and thirds. Anyone looking for Buff Black, or White Orpingtons must visit Mr. Harley's Featherly Farm at Redlands, if he wishes to see the best egg-laying strains combined with the highest standard of perfection in form and colors.

FORTUNES IN DAIRYING.

Passing of the oldest dairy in Southern California. On the 17th of April, the Wright Bros, Green Meadow Dairy, located one mile west of Watts, will be sold at Auction. This sale deserves more than passing notice, as the dairy was established in 1861.

Mr. Geo. W. Wright bought the neucleus of the herd across the plains in 1861, and located at the present site, owning about 1000 acres. His sons have all made fortunes in the dairy business. The father retired in 1879. Reason and O. F. in 1885, J. C. in 1899, and S. L. in 1906. At present the dairy is under the management of Messrs. Reed & Bennett, two progressive dairymen, and Mr. Wright informs us that there never has been any contagious disease in the herd. There are 300 head of fine milk cows, large producers, many giving 60 pounds per day.

Mr. R. R. Briggs, of the firm of Briggs & Weber, auctioneers, will be on the block, and expects to sell a cow a minute. Sale at nine thirty A. M. prompt. We call the attention of our readers to their "Ad." on page 372.

You'd better see my ad, page 376, for I'm a spunky little Checkerboard Chick.

Irrigation and Pumping

RAINFALL AND IRRIGATION.

THE amount of rain and the time it falls are clearly the most important factors in determining the necessity for irrigation. Absence of rainfall makes a desert of the richest soils at all elevations and at all exposures.

Its only remedy is irrigation. But there are degrees of poverty in rainfall, and thorough tillage will often lessen the ill effects of a scanty supply, so that an oasis may be made to appear without water beyond that supplied from the clouds. This is the triumph of tillage in the arid region which is to be considered in another connection.

The line between adequate and insufficient rainfall cannot be closely drawn. If one should undertake to determine the need of irrigation by the local rainfall figures alone and proceed to investment on that basis, he would be quite likely to lose his time and money. This has already been suggested in speaking of the relations of soils and irrigation.

It is obvious that there must be somewhere a point at which the rainfall is insufficient for the needs of crops, and another point beyond which it becomes ample or even excessive. But these points are not fixed. They vary with the character of the crop, the soil, exposure, the distribution of the rainfall through the year, and the local temperatures which fix the length of the growing season.

With reference, however, to the growth of common orchard fruits, which are alone in view in this discussion, irrigation is not resorted to at a number of points where the local rainfall sometimes is as low as 15 or 16 inches, but that with less than that amount, unless the soil receive additional moisture by underflow, it is essential. On the other hand, irrigation is regularly practiced in some localities where the rainfall sometimes rises to 45 inches.

A study does afford, however, ample evidence that, under average conditions of soil depth and retentiveness in the region under consideration, the amount of rainfall which may be considered adequate for orchard trees under good cultivation is abount 20 inches.—Prof. E. J. Wickson.

IRRIGATION PRACTICE.

On the famous river-bank fruit land of the Sacramento valley, with loams of great depth and good retentiveness, and with an average rainfall of approximately 20 inches, irrigation is resorted to only in years of minimum rainfall, when the precipitation is perhaps only about half the average.

At nearly the same level, where the soil is shallow and overlies hardpan, regular irrigation is required. But still more marked contrast is found in the foothills within sight of these valley fruit lands, where with twice the average rainfall irrigation must begin early in the summer and continue until autumn is well advanced, because, first, the slope is so rapid that much rainfall is lost by run off; second, the soil is too shallow above bed rock to hold much water.

Even here, however, there comes in a local variation of measurable effect. When the soil lies upon vertical plates of bed rock much water is retained between them and is capable of being reached by tree roots, while soil lying upon flat plates of rock has no such subterranean reservoir. In the foothill region there also occurs exceptional exposure from slopes facing the mid-summer sun in an atmosphere whose dryness is but slightly ameliorated by the influence of air currents from the coast.

In the valley and foothill contrast, just cited, the unirrigated valley looks up to the irrigated foothills. There are also places where unirrigated hill slopes look down upon irrigated valleys.

The uplands of San Diego county are nearer the coast than those above the Sacramento valley. They, too, have a rainfall usually ample for deciduous fruits suited to their elevation.

Their rolling plateaus of deep soil, free from excessive heat and evaporation which occur on highlands farther inland and 500 miles farther north, produce very successfully without irrigation. In this region, however, the rainfall in the valleys below is often less than the needs of even deciduous fruit trees, and waters flowing from mountain snows through a region of unirrigated uplands must be used to irrigate them.

Still another striking contrast, and one involving another and wholly different factor, is found in the San Joaquin valley. Near Visalia, 2 feet above river bottom and 4 feet above the surrounding plains, there is a large area of deep alluvial soil with much decayed vegetable matter. The land is moistened by underflow from the river, and, though the rainfall is but 7 1-2 inches, deciduous fruits are grown without irrigation. In the same county, and only 18 miles distant, there are areas of rich loam mixed with granitic sand 16 to 18 feet deep. In this locality, though the rainfall is 11 1-4 inches, irrigation is practiced freely, as the loss of moisture in summer is very great.

TILLAGE AND IRRIGATION.

Tillage, particularly during the dry season of the year, under some conditions, directly determines the need of irrigation, and is to a certain extent, as the popular phrase goes, a substitute for irrigation.

Under all conditions surface tillage, by promoting conservation of soil moisture, is determinative of the actual duty of water, whether it be from rainfall or irrigation. The effect of frequent surface tillage has been accurately determined by investigation and experiment, both in humid and arid regions.

These experiments fully support the view taught by the experience of about half a century in California, in accordance with which thorough winter and summer tillage has been so widely practiced in the arid section as an essential to successful fruit growing. There are, however, some conditions in which clean cultivation during the season of highest heat may not be the best practice, as will appear later.

The relations of tillage to soil moisture include both reception and conservation. For the reception of moisture, deep work with the plow, and sometimes with the subsoiler also, is almost indispensable.

To retain this moisture and to prevent, as far as possible, its escape into the thirsty air of the arid region by surface evaporation, less depth and more thorough surface pulverization are required. Recent practice has been tending toward deeper summer cultivation, so that 5 to 6 inches of loose, finely divided soil is now obtained where formerly half that depth was considered adequate.

It has also been shown that frequent stirring of this fine surface layer checks evaporation, even when no water is applied to compact the surface or where no weeds grow to draw upon the soil moisture. In a word, the aim of tillage in the arid region, so far as it relates to moisture supply in the soil, consists in opening the soil to rain, or to irrigation, and in subseqeuntly closing it to evaporation.

ENGINES AND HORSES.

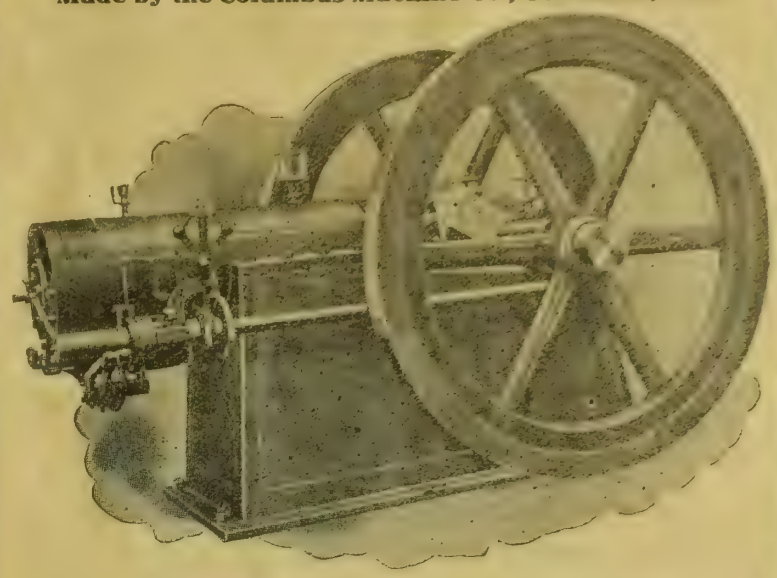
The farm horse must soon recognize the traction engine as a competitor. What will then be the result? Poor and inferior horses will not be worth their feed and keep. Only the well-bred, well-formed horse can stand against this form of competition. The automobile is yet an expensive plaything.

One or two more turns of the wheels of invention and the "auto" will be an economic farm factor. It is time that our farmers should have a weather eye out for these impending changes. The German coach, the standard bred, the draft breeds, will be more important ten years hence than today.

There is a Reason why you should buy

Columbus Engines

Made by the Columbus Machine Co., Columbus, Ohio



Simplicity—Highest Efficiency—Economical
Highest Grade of Material—Best of Workmanship

They have been in the field over fourteen years.

Their output is one of the largest in the United States.

What does this mean? It means that the present standard they are maintaining on Columbus Engines is the result of fourteen years labor of experienced mechanics with one of the best equipped plants in the United States behind them, to produce an engine which is simplicity in itself.

Free from all complicated and trappy devices. It don't take an expert mechanic to see the simplicity and good points on the Columbus Engine over other makes.

It don't take an experienced mechanic to operate it. We carry complete stock at all times. Come in and let us show you.

Estimates given on complete pumping plants.

Correspondence Solicited.

Greenleaf Compton Co., Agents

121 So. Los Angeles St., Los Angeles

If you can't come write us and we will send our representative.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

POMONA MANUFACTURING COMPANY

Corner of Bertie and Gibbs Streets **POMONA, CAL**

Rain, sun, wind, heat and cold play havoc with most roofs—but not with Genasco Ready Roofing.

No winter's cold can crack it; no summer sun can dry it out; no drenching rain or melting snow can make it leak; no sparks or brands can fire it. Your barn, house, and all buildings on your farm, with their contents, are safe under a Genasco roof.

Smooth and mineral surfaces—several weights. Easy to apply. The most progressive dealers everywhere sell Genasco Ready Roofing. Book 35 goes into full details. Write for book and samples.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Market Quotations.

I wish to inquire about your market quotations. I never paid any attention to such things before and do not know what they stand for.

Please tell me when you give eggs per doz. 20 cents, does that mean what the consumer can buy them at or does it mean what the commission merchant will pay producer? Does 15 cents per lb. for hen mean live weight as producer sells her to commission men? Ducks, 15@16 means what? How much would one add to these prices to give an estimate of price consumer would have for eggs and poultry? Shall be greatly obliged for this information.—W. D. G., Lordsburg.

Price for eggs is fixed by Produce Exchange and is the one paid to buyer or commission man by the retail grocers.

The price of poultry is live stock price, that paid to the farmer or producer. Our live stock quotations are on the same basis and are the prices furnished us by Simon Maier and Cudahy Packing Companies as the schedule offered to the producer. Not all prices paid to consumer can be obtained by the Cultivator and in such cases we aim to explain how to get "down to bed rock" as per note above honey prices.

Our market reports constitute the hardest, most difficult and unsatisfactory work on the paper.

Breeding Mares.

Is it detrimental to the future value of a mare to breed her the second and third years?

Our mare will foal in a few days; she will be three years old the 1st of April. If it will not injure her in anyway we would like to breed her again nine days after foaling. She is a fine large animal, weighing 1200 at two years and six months.—W. G. W., El Cajon.

I would not consider it at all wrong to continue to breed the mare as long as she is well fed and not worked, we usually breed them at two, raise two colts and then skip a year while we put the mare to work and get her in good trim. Then if the colts show up well we try to raise two more from her and then sell her, for by that time she usually has a daughter in the breeding string. In this way we are constantly improving the quality of the brood mares on the ranch. We do not like to raise a colt from her the fourth year, while she is being broken to work as there is considerable risk of her slinking and when this occurs the chances are against her ever being a reliable breeder again.—M. E. S.

Of course I like Purina Chick Feed, for I,m a Checkerboard Chick. See my ad, page 376.

Rhubarb Culture.

Last week a subscriber sent in an inquiry as to how to handle rhubarb in the garden. We sent this to Mr. J. B. Wagner, of Pasadena, who is better qualified to answer than anyone we know. He says:

"Plant Rhubarb, summer sort so crown is about one inch under surface. Winter sort, just as deep as it originally grew, or so crown is just at surface, otherwise it will be smothered. A good sandy rich loam is best for general purpose. However, any soil that grows good vegetables is O. K. Plenty of well-rotted cow manure worked thoroughly in soil is decidedly beneficial. Keep ground from getting too dry during summer."

Eucalypts for Hesperia.

Can you tell me if there is any Eucalyptus that will do well here on the Mojave river bottom; elevation 3000 feet, soil sandy, last winter 5 degrees below, and 5 feet of snow.

E. Rudis six years old froze up, and the bark split wide open.

Also would the black locust and Arizona ash be suited in this locality, and at what time should the seeds be sown?—S. C. L., Hesperia.

No Eucalypt will grow with you, black locust and Arizona ash will. Plant now.

Lousy Cows.

Editor Cultivator: I have two cows which are lousy. I have only had them a short time; what is the remedy? Also what is the proper amount of oil cake for a feed for a cow.—C. D., San Bernardino.

Use creolin, 5 per cent. solution. Spray or swab it on to saturate the hair, next week repeat so as to destroy the nits that have hatched. Tobacco stems boiled to a coffee-colored mixture is also good. But do not fail to repeat the week following or the first application is useless.—M. E. S.

Non-Kicking Device.

We have received the following letter from Riverside county:

"Wnen can I get address of party advertising in the Cultivator, 3 or 4 years ago, a device to prevent cows kicking? A party in Riverside bought one and it is a great success and I wish to get one.

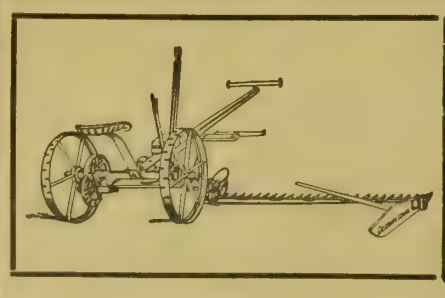
Will party who advertised do it some more? If so, they are welcome to this and other letters of inquiry along same line.

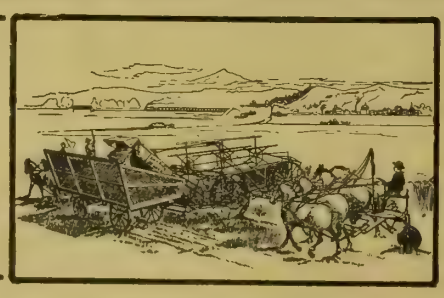
Horse Cough.

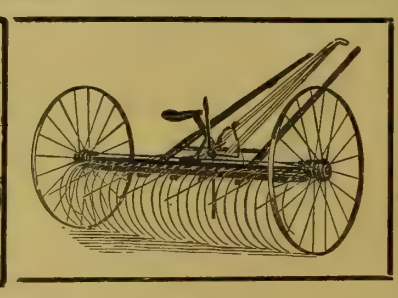
My horse has a dry cough. I feed bran and oat hay. Please let me know cause of cough.—F. Y., Lodi.

Ask this question again giving more particulars. If a chronic cough the only thing to do is to feed the horse well and use a blanket at night and if warm from driving blanket him until cool, then rub off well.—M. E. S.

Minorcas are called the "middle weight egg machine." They are also a good table fowl, weighing six to seven pounds for hens and nine or ten pounds for roosters. They are non-setting. The large comb is the principle objection to them.







Implements for the Ranch

We can supply **everything** that is needed in ranch implements. You can't afford to buy without first getting our prices and inspecting our goods. The Ornamental Garden

By ERNEST BRAUNTON

CUT FLOWERS.

CUT flowers cannot be arranged very satisfactorily among growing plants. The cut flowers are better for vases on the mantel or piano and dining room. In home decorations never undertake elaborate effects; simple arrangement is always the most artistic. There is a wide field for good work in home decoration.

We cannot all be artists, but we can at least cultivate good taste. We can study the value of colors and learn how to combine them in such a way as to produce harmonious and pleasing effects. The highest effect of true art consists in being natural. Home decoration deserves to be popular, it encourages originality, develops artistic taste and makes the farm home attractive.

CHESTNUT.

The chestnut (Castanea dentata) is among the largest of our hardwood trees, and in the region of its best development has been known to reach a height of 120 feet and a diameter of great size. Throughout the greatest part of its range, however, it is much smaller, with an average height of 80 to 100 feet and a diameter of from two to four feet.

EUCALYPTS FOR TIMBER AND FUEL

Continued from First Page

Every Eucalyptus plantation must be carefully guarded from fire. The fallen leaves, twigs and bark shreds, which always cover the ground to considerable depth, are naturally oily, and in the dry air of the Southwest become highly inflammable. If a fire once starts it is almost impossible to put it out before the heat, if not the direct flame, has killed or seriously injured the trees. The bark of the trees is not thick, and affords little protection to the living tissue.

Since it is always advisable to reproduce a Eucalyptus grove by means of stump sprouts, care should be taken that the trees are felled between November and April, and that the stumps are cut low smooth and slanting on top. When the cutting is done at the right time the sprouts are vigorous and have time to harden, while the roots are not exhausted. The stumps should be low, in order that the new shoots may be forced to start close to the ground and establish their own roots as soon as possible, and smooth and slanting, so that rain water may not gather on them and hasten decay. When the shoots reach a diameter of about 2 inches, all but three or four of the straightest, most vigorous, and best placed ones should be cut out from each cluster. This thinning should yield enough firewood to pay for the cost, but whether it does or not it should not be omitted, for it will cause the remaining shoots to grow much faster by giving them more light and room.

Cost and Returns.

Windbreaks are usually made without much reference to their cost, for they are often indispensable. Woodlots, on the other hand, should pay at least as much, either directly or indirectly, as the land they occupy would yield in any other crop.

The cost of establishing a plantation of the blue gum will depend largely upon local wages. The cost of maintaining it when once established depends entirely on the rental value of the ground. The following figures may be accepted as the average cost of establishment for an acre in most localities. All expenses, with compound interest at 5 per cent. are carried to the time when the plantation is 12 years old and yields its first crop:

Preparation of soil	$7.00
700 plants, at $8 per thousand	5.60
Planting	4.00
Cultivating 5 times, first year	2.50
	19.10
Interest on $19.10 for 12 years	15.20
Cultivating 3 times, second year	1.50
Interest on $1.50 for 11 years	1.06
Total cost, excluding land rent, at end of 12 years	36.86

Disregarding the small possible yield from thinnings before the main crop is mature, the wood that can be cut at the end of twelve years will probably amount to 60 cords. This will bring $3 per cord on the stump, or a gross income of $180.

The net income at the end of twelve years is what remains after deducting the gross cost of the plantation exclusive of rent, $36.86, from the gross income, $180, or $143.14, which is equivalent to an annual net income of $9 with interest at 5 per cent. If the rental value of the land is $5, the annual net profit would be $4; if the rental value is $6, the profit is $3, and so on.

After the first crop, the returns will be greater, because planting and cultivation will be saved and the trees will be large enough to cut again in eight years. For the second and succeeding crops, the yield will be 60 cords of wood at $3 per cord, or $180, which, since there is no expense, is the net income from 1 acre for eight years, equivalent to an annual net income of $18.85. Again assuming a land rental of $5, there remains a net profit of $13.85 per acre per year.

Red Gum (Eucalyptus rostrata).

This species does not grow so rapidly as blue gum, but in most other respects is superior to it. Comparatively few plantations have so far been made in the United States, but those that are established give promise of quite as good returns as any of blue gum. The tree is more hardy than the blue gum, and will withstand more alkali and more drought than the latter. When young, it is nearly as susceptible to frost as the blue gum, but mature trees may survive as low temperature as 15 degrees F.

The wood is heavy and hard like that of blue gum, but is red in color and much more durable. This last quality apparently makes it available for posts, poles and piles, and goes far to recommend it in preference to blue gum. Plantations may be made in the same way as those of the commoner species, and at about the same cost. Planters are recommended to give this tree a trial, especially where there is a demand for other material than firewood.

Sugar Gum (Eucalyptus corynocalyx).

The chief value of this species is that it endures more drought than either of the others described. In most of its qualities it is simliar to red gum, and under good conditions grows nearly as rapidly.

The wood is heavy, not so hard as blue gum, easy to split, makes a very hot fire, and is moderately durable. It is also said to season better and to work more easily than the wood of other Eucalypts.

The tree may be propagated in the same way as blue gum, and is recommended for planting because of its good qualities, among which is its ability to grow in localities where the heat and drought are too severe for other species.

Mayer

Martha Washington

Comfort Shoes

are made for genuine comfort. It is a pleasure and relief to wear them. There are no buttons to button or laces to lace. You just slip them on and off at will.

The elastic at the sides expands and contracts with the natural motion of the foot, insuring perfect ease and comfort. Can be worn all year round.

Three styles, low, medium and high. Your dealer will supply you. If not, write to us. Look for the name and trade-mark on the sole.

We also make the popular "Western Lady" shoes.

FREE Send the name of a dealer who does not handle "Martha Washington" shoes and we will send you free, postpaid, a beautiful picture of "Martha Washington," size 15x20.

Household Department

WE HAVE BEEN FRIENDS.

We have been friends together
  In sunshine and in shade
Since first beneath the chestnut tree
  In infancy we played,
But coldness dwells within my heart,
  A cloud is on thy brow—
We have been friends together;
  Shall a light word part us now?
We have been gay together;
  We have laughed at little jests,
For the fount of hope was gushing
  Warm and joyous in our breast,
But laughter now hath fled thy lip,
  And sullen glooms thy brow—
We have been gay togethher.
  Shall a light word part us now?
We have been sad together;
  We have wept with bitter tears
O'er the grass grown graves where slumbered
  The hopes of early years.
The voices which were silent there
  Would bid thee clear thy brow.
We have been sad together;
  Shall a light word part us now?
—Caroline E Norton.

FIVE STORIES UP.

"THE most thrilling sight I ever saw," said the foreman of the composing room, "was when I had a case on a Buffalo newspaper.

"The paper had been sent to press one morning, and most of the compositors, except the emergency men, had hurried home, so as to get to sleep while it was still dark. Several of us had remained behind to paste up our strings. What? 'Strings?' Why, strings of 'dupes.' Proofs of the stuff we'd set for the week, you know, pasted end to end, so that it could be measured for our pay. Well, one of the fellows who had gone out came hurrying back, and yelled, 'The Carlton's on fire!'

"The Carlton was then one of the best hotels in Buffalo. We all jumped and rushed up Washington street, but by the time we had run the few blocks the big hotel was belching smoke and flame on every side. The firemen were taking guests and employes out of windows and down fire-escapes, and there were many brave rescues; but in spite of everything some people lost their lives.

"We made our way round to the Main street side. We saw some horrible sights that night. Window after window crashed outward and fell in a clattering of glass upon the pavement, to be followed by blasts of flame and smoke.

"'It's all over for those who aren't out,' remarked my companion. Suddenly he gave almost a sob, and pointed up to a window five stories above us. A man only partly dressed was crawling out of the smoked-filled room up on the narrow stone window sill.

"There did not seem to be the slighest chance for the man. With the greatest deliberation he stepped out on the narrow stone ledge, and carefully closed the window behind him.

"This, we knew, could keep the flames back for only a few moments, but in those moments he took a chance to prolong his life which struck the spectators almost breathless. The window ledges on that floor were continuous along the side of the building, projecting only a trifle over five inches from the brickwork. Some one had recognized the man now. It was the assistant manager of the Carlton Hotel. He had been caught by the fire on the fifth floor, while making desperate efforts to warn everybody of the danger, Coolly and carefully he pressed his back close against the wall, and with nothing to cling to on the smooth brickwork, and with room on the narrow ledge for scarcely more than his heels, he edged his way, sidewise inch by inch away from the window. Hardly had he cleared the opening before the flames broke through the window in a great burst of sparks and smoke. The room into which the next window led had already become a seething furnace.

"How the man stood on that narrow ledge for the next few minutes will be a mystery now, even to himself. It was a marvel of nerve and clear-headedness, but his desperate efforts to save himself seemed futile. No ladder could reach him, and with every window on the Main street side vomiting destruction, the scaling ladders were useless.

"Suddenly the great Hayes truck swung round the corner from its work of rescue on the Eagle street side of the building, paused near the center of the street, and the massive ladder began to build its way up until it had attained its full height, when it was found to reach but a trifle above the third story. The last beckoning of hope seemed to have gone.

"The great ladder was being swayed backward and forward in the air, and in toward the building against the masses of wires, while the unfortunate man stood like a bit of carved relief work, flattened, motionless, against the wall of brick, the fierce glare of the flames beating upon him like a calcium light. It seemed that in a moment now he must fall, and be crushed to death on the pavement.

"But suddenly, as the top of the ladder swayed back and forth in the air, in to within ten or twelve feet of the building—back—and in again, an almost imperceptible movement of preparation could be discerned in the body of the intrepid man. As a last desperate chance, he was going to attempt the leap to the top of the swaying ladder almost two stories below him, and far out from the building.

"At almost the same instant the crowd and the firemen seemed to divine his intention. A fireman dashed up the ladder to the very top, to be ready with a strong arm; and, the mechanical swaying of the ladder in toward the building was made stronger and more regular. There was not a moment to lose. The flame and smoke were enveloping the entire front of the building, and as it cleared away momentarily the manager could be seen gathering himself for his mighty effort.

"Never in the greatest hippodromes of the world has the daring feat of an athelete had a more dramatic setting or spectators more thrilled and breathless. Three times the ladder swung slowly inward, and three times the man seemed to gather himself for the spring, and then hesitate. Inside the building a floor fell with a crash, and as the ladder swayed back for the fourth time, and a great blast of sparks and flames shot out from the tower at the tower at the corner, as with one voice the firemen and the people shouted, 'Now!'

"The ladder swung slowly inward and at the same instant the manager leaped far out through the air.

"Down he plunged; the fireman on the ladder braced himself for the shock, and then a dense cloud of smoke swept across the street, enfolding everything; but in an instant it cleared away, and two men clung to the top of the ladder, unharmed, while high above the horrid roar of the flames and the din of the engines came cheer on cheer from the vast throng in the streets.

"And that," concluded the foreman, as he hung his apron on the "dead copy" hook and took his coat from the peg in the wall back of the job press, "was the most thrilling sight I ever saw or ever expect to see."—Charles Newton Hood in Youth's Companion.

FARMER'S FUEL.

Under the perfected law the manufacture of denatured alcohol on a small scale by farmers will become practicable, and the production of this material should be largely increased. The amendments providing for central denaturing warehouses, to which the alcohol produced in small distilleries can be transported in tank cars, and there denatured, are also of direct interest to the farmers.

I am particular about eating. Nothing but Purina for me, for I'm a Checkerboard Chick.

My lamp-chimneys break through abuse—not through use.

My Index tells how to get the right size for your lamp. It's free; let me send it to you.

PA'S HOUSECLEANIN'

When the April's sun's a-shinin' hot an' things is nice an' fresh,
When the willer's droppin' tossels an' the blackbird's in the bresh,
An' pa comes in fer noonin' an' the floors is wet as souse,
Then it's "Laws-a-massy on us! Your ma's a-cleanin house!"

Then me an' Jim is sure to find rag carpets in the sun
When we'd planned to go a-fishin' fer the suckers in the run;
But while pa takes his noonin' an' the hosses eats their snacks,
Us boys can beat them carpets while we're restin' up our backs.

An' then next day pa's certain sure to have to go to town;
But he always leaves us orders, "Help to put them carpets down."
An' at night, when he gets home again, you'd think, to hear him groan
About the hardship of it, that he'd done the job alone.

Poor ma! She has it awful hard, she'll work until she drops.
An' pound her thumb nails half way off, an' wet her feet with slops;
She'll get so hoarse that she can't speak, an' sore at every bone;
But pa, he says if it was him he'd let the house alone.

An' when that night the kids is sick an' has to have a drink,
An' ma she can't get up because her back's in such a kink,
If pa should bang the furniture whilst gropin' fer the cup,
You can feel him gettin' mad enough to fairly eat her up.

So me an' Jim was sayin', if the time should ever come
When pa and ma should change their work an' pa should stay to hum,
I would't like to be a boy, but jest a little mouse
To hear what things pa would say if he was cleanin' house.—Woman's Home Companion.

TUFTED BED SPREAD.

Get three-quarters sheeting (unbleached is best.) Take a breakfast plate, and laying face downward exactly in the middle of the sheet, which is spread out, mark around with pencil or grease the edge of the plate, which will make a mark khen pressed down on the cloth. After marking off the first circle you can arrange the others in rings around that one, or let the circles lap over each other. You can make your own designs if you prefer. If you use unbleached, first work it by outlining the design with a long baste stick on the right side and short on the wrong with white cotton knitting thread doubled in the needle, then bleach by wetting and rubbing thoroughly with soap and leave out in the dew for several nights. After this boil out, rinse thoroughly and after it is dried and ironed cut the thread on the right side, which causes it to tuft. You then have a neat spread as easily laundered as a sheet.

A WOMAN.

"Can throw out of the window with a teaspoon more than a man can bring in on a shovel" is a most homely old saying with much truth.

A few out of many dozens of ways of filling the teaspoon of waste are:

Buying articles simply because they are cheap and expected to "come in handy" sometime.

Using sheets for ironing tables, napkins for dish towels, and towels for dishcloths.

Using silver forks and spoons in the kitchen.

Opening tinned meats, preserves, etc., forgetting all about them, and leaving them to spoil.

Letting pieces of bread dry and mold, and then throwing them away.

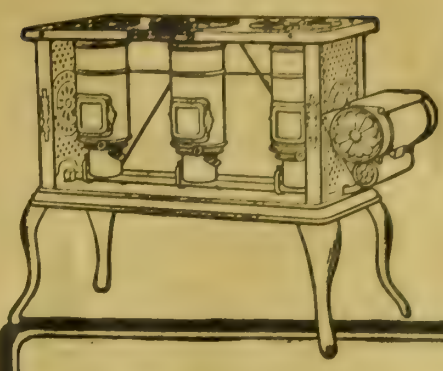
Placing brushes with the bristle side up.

Wearing the same clothing each week as it comes from the laundry.

Using the same table and bed linen each week as they come from the laundry.

We're two lusty little Checker-board Chicks.

See our ad on page 376



The New Oil Stove

Different from other oil stoves. Superior because of its economy, cleanliness, and easy operation. The

The Produce Markets

Los Angeles Markets

LOS ANGELES, APRIL 3, 1907

Trading in the produce market was very quiet this morning. The weather was against activity and the reaction from the lively business during the week preceding Easter is still felt in the market.

BUTTER

There was no change in butter prices. Receipts yesterday were not so heavy as on the day previous, but there is just about a sufficient amount on hand hand to fill orders.

Valley Creamery 67½
Coast, fy, ...60
Cooking 20

Cheese

Cal. Young American, per lb. 21
California Anchor 20
Cal 3-lb. hand 21
Northern 18
Domestic Swiss 22
Imported Swiss 30

Eggs and Poultry

Egg receipts yesterday were nearly as heavy as those of the day previous and the market was decidedly easier, but owing to the fact that dealers can store all of the surplus at present quotations prices did not go lower.

Eggs, local, per doz 20
Northern Candled 19
Fresh Eastern 18

The following are average prices which dealers pay to producers for live weight:

Hens, per lb. 16
Young Roosters, per lb. 21
Fryers 22
Broilers, per lb. 24
Old Roosters 8
Turkeys 17
Geese .. ..15@16
Ducks .. ..15@16

Live Stock

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs, 200 lbs. .....7.75@8.00
Prime Steers. 5.50
Heifers 4½
Calves, per lb 5
Sheep, ewes, per head 5.50
Lambs, per head 4.00
Wethers 5.50

Potatoes

The potato market is still very unsettled and a little inclined to weakness. A few brokers are endeavoring to prevent a break by holding their prices up, but bidding is weak and even some dealers are more inclined to sell than to buy.

Salinas 2.50
Sweets, Yellow, per sack 5.00
Colorado 2.05
Minnesota 2.00

Vegetables

Vegetables were in abundant supply this morning, while demand was lacking .

Asparagus, lb .....13@17
Beets, per doz ....40@60
Bell Peppers, Green, lb 5
Cabbage, sack 1.50
Chili Peppers, Green 30
Chili, Dried, per lb... .....13½
Cucumbers, per doz .....1.50@1.75
Cauliflower, per crate 3.00
Carrots, per doz. ..... 40@50
Celery, per doz .....30@50
Egg Plant, per lb 15
Garlic per lb 6
Green Onions, doz. bunches .....25@30
Lettuce, per crate 1.00
New potatoes, per lb. ..... 5@6
Lima Beans, per lb .....7@8

Bermuda onions were offered again, to arrive next week, at the extreme high price of $3.25 per crate. This is the first car that is to be shipped here this season from the Imperial Valley, and it is said there will be no onions to follow from this source for several weeks, consequently the shippers feel safe in holding the price so high. However, it is reported by other Shippers that Bermudas will arrive here from another source next week. This will undoubtedly have an easy effect on the market.

Onions, Aust. Brown, sk .....135@1.50
Onions Y. Danvers .....1.35@1.50
Parsnips, per doz .....35@50
Rhubard, per lb 5

Fresh Fruits

Strawberries were abundant in the market this morning and prices went down several cents per box on account of the over-supply. It is estimated over 2000 crates of berries came in last night, and had it been pleasant weather today they would have been fairly well cleaned up, but the rain kept buyers out of the market.

33⅓%

Is about the extra cost to the buyers of many of the *cheap*(?) chick foods. Why? Waste—that's why. You buy a 100-lb. sack of so-called chick food, but if your chicks only eat 66⅔ lbs. and the rest is waste, have you not added 33⅓% to the price you paid?

The waste in many cases is lack of knowledge by the makers of what to use and the proportions to use of the various grains. In A. C. W. Chick Food you will find *no waste*. Your chicks will eat all A. C. W. and *digest* it. A. C. W. is put up in sealed sacks. Accept no substitute. At all dealers or direct from us.

A Short Story of Sunny Stanislaus

An Orange Grove Near Modesto

Stanislaus Oranges Are Ready for Market at Thanksgiving

A Stanislaus County Wheat Field

The Border Cut for Hay

The Grain Crop in This County for 1907 Should Return About $3,000,000

THE San Joaquin Valley is a great natural basin in the very center of California, and in all this great range of country "Sunny Stanislaus" county is one of the most fertile sections.

Dairying is classed as one of the leading industries of the county. During the almost incredibly short space of time that attention has been directed to this business Stanislaus County has grown in four years from twelfth to fifth place in the State in dairy produce.

Of the land now in crops, about thirty thousand acres are planted to alfalfa, which is the great crop of the irrigated lands. It is a profitable one, regarded from any standpoint. A fruit which has been planted extensively in the irrigation districts is the Smyrna fig. Extensive planting of this tree is now going on, and without doubt the locality will be a center of its production, possibly the greatest in the state. Peaches, table grapes and a great variety of fruits, even to the orange, are among the orchard assets of "Sunny Stanislaus."

Coulson's Special Dry Chick Food

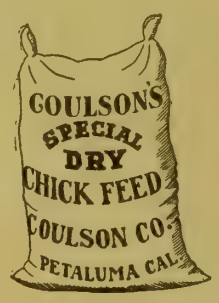
Feed to Your Chicks

And See Them Grow

Advantages of Coulson's Ready Mixed Chick Feed

The proper feeding of poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

Chicks should be given a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are best adapted to give nourishment to the growing chicks: Sweet tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other things.



It is clean, sweet feed that is easily digested, and chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks, at a cost of about 4 cents apiece.

Ask your feed dealer about Coulson's special and be sure that he does not sell you something else.

If your dealer does not keep it, write us, and we will tell you where and how to get it.

To be able to raise the chicks that you hatch and have early broilers to **SELL AT A HIGH PRICE; to raise NICE LARGE HEALTHY CHICKS;** to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Coulson Poultry & Stock Food Co., Petaluma, Cal. Milwaukee, Ore.

Gentlemen:—

While in the poultry business I have tried several brands of Chick Foods and find COULSON'S SPECIAL far superior to any other brand.

Yours truly,

(Signed.) Floyd W. Scott.

Destruction of Wolves and Coyotes

A Farmers' Bulletin, Issued by the U. S. Department of Agriculture

The losses from the destruction of stock by wolves and coyotes in the Western United States amount to millions of dollars annaully and seem to be increasing rather than decreasing. Practical means of preventing these losses are urgently needed.

The present circular, based on field work of the Biological Survey, aims to present briefly the best methods of hunting, trapping and poisoning wolves and coyotes, of finding the dens and destroying the young, and of fencing to protect stock. By the methods given herein the numbers of wolves and coyotes may be rapidly diminished and the losses of stock thereby reduced to a minimum.

Capture of Pups.

If the time of breeding, character of breeding grounds, and habits of wolves are known, the dens may be easily located and the pups secured. In this way, more effectually and economically than any other, increase of wolves and coyotes may be prevented.

The large size of the litters makes the method especially important, as wolves usually have six to ten pups, and coyotes five to nine. It is now positively known that both wolves and coyotes pair for the breeding season, and that the males stay with the females and help feed and care for the pups during the summer.

Time of Breeding.

Wolf pups are usually born from March 9 to April 15 and coyote pups a little later, usually in April and May. The pups remain in or near the dens until 2 or 3 months old.

The period of gestation with the wolf, as with the dog, is nine weeks. The rutting season for the wolf, therefore, would come in January and February; for the coyote in February and March.

Location of Dens.

In the Western United States wolves breed mainly in valley and foothill country or in low mountains. For breeding dens they choose, if possible, natural cavities or washed-out hollows on south slopes of rocky or bad land ridges. There is usually a high point not far from the den, where the old male stands guard during the day.

Even on bare ground there is little difficulty in locating every wolf den. This may be done by simply riding along the crests of the ridges until the wolf tracks are found. The tracks once found, the direction of the den can often be told from the lay of the land. Near the den the tracks usually gather into well-worn trails that may be followed on bare ground as readily as on snow.

Coyotes make their dens in the same kinds of places as wolves, and also dig burrows or use old badger holes, slightly enlarged; so a spade is often necessary in getting out the young.

Ranchmen cannot afford to let wolf or coyote pups grow up on or near their ranges when an hour's ride will often serve to locate the dens. The young pups of both wolves and coyotes are nearly black, but as they grow older the color fades to dull yellowish, and when about 3 months old a new light-gray coat is acquired.

Trapping.

For wolves the best No. 4 double spring trap with heavy welded or special wolf chain should be used. If the trap is to be fastened to a stationary object, the chain should have a swivel at each end. If to a drag, one swivel next to the trap is enough. Always use a drag if possible. The best is a stone of 30 to 40 pounds weight, to which the chain is securely wired. A long oval stone is best.

A piece of telegraph wire or smooth fence wire 5 to 6 feet long should be passed around one end of the stone, then doubled through the trap ring, with a twist to hold the ring in the middle; then around the other end of the stone and back on the opposite side to connect with the first loop. If properly fastened, a jerk on the trap tends to draw together and tighten the loops, and the spring of the connecting wire prevents a sudden jar that might break trap or chain. If an oval stone is not at hand, a triangular or square stone may be used by passing the wire over the three or four sides and securely connecting it above and below.

If no stones are to be had and it is necessary to stake the traps, twisted iron stakes that can be driven below the surface of the ground should be used. They should be of good iron straps, at least 18 inches long, three-quarters of an inch wide, and three-sixteenths of an inch thick, turned over at the top into a P-shaped loop to connect with the ring of the trap chain.

When possible, place the trap between two tufts of grass or weeds, so it can be readily approached from one side only. Bury the stone, chain and trap out of sight, with the trap nearest to the runway where the wolves follow a trail or road, cross a narrow pass, or visit a carcass. The trap should be flush with the surface of the ground and the jaws and pan covered with a piece of paper to keep the earth from clogging under the pan.

Fine earth should then be sprinkled over the paper until all traces of trap and paper are concealed. The surface of the ground and surroundings should appear as nearly as possible undisturbed. The dust may be given a natural appearance by sprinkling it with water. Touching the ground or other objects with the hands, spitting near the trap or in any way leaving a trace of human odors near by should be avoided. Old, well-scented gloves should be worn, and a little of the scent used for the traps should be rubbed on the shoe soles. A piece of old cowhide may be used to stand on and to pile the loose earth on while burying the drag and trap.

For coyotes use the best No. 3 double spring trap, unless in a wolf country, where it is better to use a trap strong enough to hold a wolf. In setting the trap use the same method and bait as for wolves, but the traps may be staked or fastened to a stationary object with more safety.

Use of Scents.

Success in trapping depends largely on the use of a scent that will attract wolves and coyotes to the traps and keep them tramping and pawing there until caught. Meat bait alone is of little use and often, indeed, scares the animals away. Of the many scents and combinations tested the fetid bait has proved most successful.

Fetid bait.—Place a pound of raw beef or venison in a wide-mouthed bottle and let it stand in a warm place (but not in the sun) for two to six weeks, or until it is thoroughly decayed and the odor has become as offensive as possible. When decomposition has reached the proper stage add a quart of sperm oil or any liquid animal oil. Lard oil may be used, but prairie-dog oil is better. Then add 1 ounce of tincture of Siberian musk, or Tonquin musk. If this cannot be procured, use in its place 1 ounce of dry, pulverized castoreum (beaver castor) or 1 ounce of the common musk sold for perfumery. Mix well and bottle securely until used.

After setting the trap apply the scent with a stick or straw or by pouring from the bottle to the grass, weeds or ground on the side of the trap opposite that from which the wolf would naturally approach. Never put scent on the trap, as the first impulse of the wolf after sniffing the scent is to roll on it.

This bait is very attractive also to cattle and horses, which are sure to tramp over and paw out the traps if set where they can get at them.

Poisoning.

No poison has as yet proved so effective as pure sulphate of strychnine, provided the proper dose is used. The most effective dose is 4 grains for wolves and 2 grains for coyotes. The common 3-grain gelatin capsules sold by druggists will hold, if well filled, 4 grains of strychnine and are better than the larger capsules. The regular 2-grain capsules should be used for coyotes. The capsules should be filled, securely capped, and every trace of the intensely bitter drug wiped from the outside.

Each capsule should be inserted in a piece of beef suet the size of a walnut and the cavity securely closed to keep out moisture. Lean meat should not be used, as the juice soon dissolves the gelatin of the capsule. The necessary number of poisoned baits may be prepared and carried in a tin can or pail.

They should never be handled except with gloved hands or forceps. The baits may be dropped from horseback along a scented drag line made by dragging an old bone or piece of hide well saturated with the fetid scent, or they may be placed around or partly under any carcass on which the wolves or coyotes are feeding, or along trails which they are in the habit of following.

Gelatin capsules quickly dissolve in the juices of the stomach. Strychnine taken on an empty stomach sometimes kills in a very few minutes, but on a full stomach its action is much slower, and the animal may have time to travel a considerable distance.

Hunting with Horses.

Running wolves with horses is an expensive method of capture, though occasionally successful. With coyotes it is more common and more generally successful and in either case affords thrilling sport.

Hunting with Dogs.

Hunting wolves with dogs is usually unsuccessful, as few dogs have ever proved able to kill or hold a wolf. Ordinary trail hounds are said to drive them out of a region, but the relief is only temporary, as they soon return.

Such dogs cannot catch wolves, and the wolves often turn and kill a number of the pack. Coyotes, on the other hand, are readily caught and killed by large greyhounds or wolf hounds, which run by sight only.

Shooting

Hunters occasionally make a successful shot at a wolf and more often at a coyote, but generally hunting does not pay. However, by watching near the dens in the early morning or at dusk before the young are taken out a good hunter is sometimes able to shoot one or both of the parents.

Coyote-proof Fences.

Under present conditions it is entirely impracticable to fence any great part of the western stock range against wolves and coyotes, but in many cases limited areas may be fenced to advantage. In sections where cattle are fed during the winter months, wolves often kill them on the open feeding grounds.

These, as well as small home pastures, for both cattle and sheep, could be inclosed with wolf and coyote-proof fences at relatively slight cost, often less than the value of the stock killed during one season. Preliminary tests of fences have been made by the Biological Survey, and until more thorough tests can be carried out the following is recommended as affording protection against both wolves and coyotes. Further experiments will probably show that a more economical fence can be constructed.

On posts 7 feet long, set a rod or a rod and a half apart, should be stretched one closely barbed wire along the surface of the ground. Three inches above this should be set a 36-inch strip of woven-wire fence of not over 5-inch mesh, and above this two barbed wires 6 inches apart. In the North another wire, 8 inches above these, may be added to provide for a moderate depth of snow, making a close fence practically 5 feet high. To prevent the wires from sagging away from each other, a vertical wire may be wrapped about each, at intervals of 8 feet, by a hand machine.

A fair grade of suitable 36-inch woven wire may be bought at an initial cost of 25 to 35 cents a rod, and barbed wires from 3 to 5 cents per rod each. The actual cost of fence, made as directed, can be computed only for localities where the cost of barbed wire, posts and labor is known, but

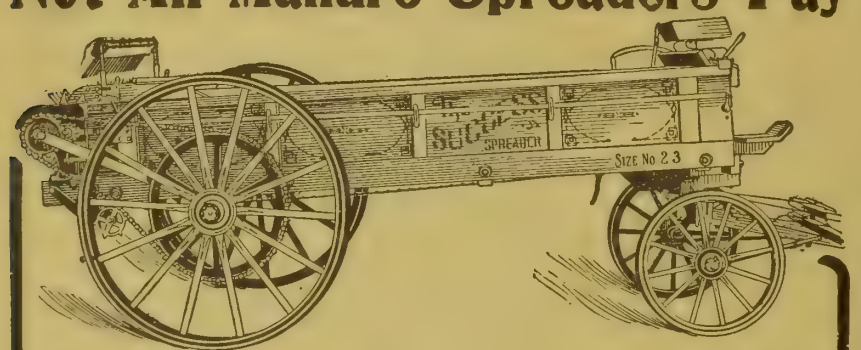
Not All Manure Spreaders Pay



The Idea of spreading manure properly is such a good one and the benefits derived are so great you are apt to think *any* spreader will give you these benefits—that a spreader is a spreader.

There is where you may make a mistake, for some spreaders are only trouble makers and the second season they are not taken out of the shed. To make them work takes too much time and costs too much money.

If you get that kind of spreader you're apt to conclude that spreaders are made to sell and not to spread manure.

SUCCESS SPREADERS

have 28 years' experience back of them—thousands of them are spreading manure on the best farms in the country and are giving no trouble.

Twenty-eight years has eliminated the trouble making features—out of a hundred new devices and schemes that we have tried perhaps ninety have proved more harmful than helpful. They make good talking points but they don't help spread manure. SUCCESS Spreaders are made to spread manure.

When you get ready to buy a manure spreader, (and every farmer should have one) first write for our spreader book, it will help you; next go to your local dealer and see a Success Spreader but don't buy one until you have asked a man who has used one. He knows.

Deciduous Fruit Culture

By J. W. MILLS

GRAFTING OLIVES.

THE experimental stage of olive growing is practically past in most sections of California, though it has not been so generally tried out in the now recognized olive sections of the northern part of the state.

Range in Size of Fruit.

While it is there known, as well as in the south, that the best all-around olive is the Mission, still some of the larger sizes of later introduction are known to be particularly fine and prove more productive than when grown in the south.

There are always a number of trees in plantations of any size, which are not up to standard, and there were at one time many trees of the wild olive planted throughout the state. This happened through the importation of trees and cuttings made when little was known of the industry in this state, and we were imposed upon by the foreigners who supplied the cuttings. It is very desirable to graft these poor varieties, and some of the finer varieties, which have proven to be of little or no value in certain locations.

Easy to Graft.

The olive is very easy to graft, but is not usually budded successfully. There seems to be little difficulty in getting the small piece of wood and bark containing the bud to grow, but if the bud itself has never made a growth or developed into a small twig, nine times out of ten it will never start.

Twig buds are the best, but they often fail. A twig bud is one which has recently made a twig which should not be more than an inch long. The leaves which have formed on it should not be left entire, but should be cut back half. This reduces evaporation through the bud to a certain degree and the fractional parts of the leaves keep up the respiration through the tissue and gives the buds continual nourishment.

Grafting Best.

The quickest and surest way to change an olive tree to another variety is by grafting. The season in which it may be successfully done extends from April till late in July and perhaps later. Grafting can be done at any time while the sap is running.

We have seen machine made grafts that were put in in July simply to show how the implement worked, no wrapping or wax being used, grow and make a good top. Two out of three such grafts grew, showing that it was not a mere freak. The same implement was used in a number of cases where proper care was afterward taken, and a good stand was secured. It is made on the same principle that grape grafters are made, which can be used for olive grafting also.

Scions and Suckers.

Scions must be used that will fit the cutter so that a good cut will be made on two sides, exposing the different layers of bark. That means a scion about as large as a lead pencil. It must be of last years growth with small twig buds. Dormant buds will sometimes grow and sometimes they will not, so it best to use the other.

Painting the stumps and cut surfaces where the union of stock and scion with warm wax, wrapping with cloth and painting again will make the job complete.

Allow the suckers to grow about five or six inches all over the trunks, but keep them sheared off at that length. This will protect the trees, and will not affect the grafts. After they have made a good union and start a rank growth a foot or so long, pinch off the ends and when they shade the trunks of the tree, remove all the suckers or sprouts on the trunk.

"Dry Farming" is not a dry subject to the dweller on the nigh plains. It means sure dollars where before even the dimes were often uncertain.

Many men could be righteous if they could be sure of the revenue.

COLORING FRUIT.

It is a well-known fact that the same variety of fruit will color well in one section of the country on different kinds of soils while in a different part of the country it will not color well on anyone of a variety of soils. Has any grower ever found out why?

In certain sections of the northern part of the state, Kelsey plum, for instance, will be perfectly green in color when dead ripe in maturity. In other sections it will color a brilliant red on one side.

In most situations in Southern California it will turn a dirty, greenish red that is not so attractive as the light green color developed in other places. Some writers attribute the effect to fertilizer elements in the soil and that the coloring of fruit can be controlled by fertilizers. It is our opinion that climate has more to do with the coloring than anything.

This is well-known in regard to some varieties of grapes. Some of the purplish, black varieties as grown near the coast are a jet black when grown in the desert region. Purple Damascus as grown in the Chino valley is a redish, purple. On the desert it is light in color with a faint purplish tint at the apex. Here are two examples.

Both varieties grew side by side in each locality. When grown in the desert climate, one deepened in color, ane one lost its color. This would indicate that the primary cause of change was in the variety itself. The exterior influences affected differently the individual characteristics of different varieties.

PLANTING PEACH ORCHARDS.

The land for a peach orchard, and, in fact, for many of the deciduous fruits, should be dry or of a character than can be readily drained. Peach trees particularly do not do well when planted on low, wet ground.

In planting deciduous fruit trees the same preparation of land as recommended for citrus trees is advisable. It is not often necessary, however, to use lime to any extent on virgin soils for peach trees.

Like citrus, deciduous fruit trees should be severely trimmed back when planted. Too often trees are planted with all their tops left on, as many people cannot bring themselves to cut back a tree as hard as it should be, or even at all. It looks as if that much of the top were being wasted, but, as a matter of fact, if trees are severely trimmed back when transplanted, they will almost invariably make larger tops by the end of the first year than if left with their tops untrimmed.

Peach trees are apt to set too much fruit, and this fruit should be thinned out. Commence when the fruit is of the size of a marble and continue at intervals until half grown, always removing stung or imperfect specimens. At the final thinning, reduce fruit to three or four inches apart. A heavily loaded peach tree will produce as much fruit—by measure—if three-fourths of the original number set are thinned out; and the value of the fruit on the tree that is thinned will be greater than that on the unthinned one.—G. A. Taber, Florida.

HANDLING YOUNG TREES.

When nursery stock is received, it should be immediately unpacked from the bale or box and placed in a cool, shady place, and the roots and tops thoroughly wet down. Roots of trees should never be exposed to sun and should not be allowed to become dry. Always keep them covered with moss, straw or a wet blanket when planting.

If trees cannot be transplanted immediately after they are received, they should be heeled-in in a cool, shady place and watered well until they can be set out.

If trees should be delayed in transit and arrive in a dry condition, take them out of the package and bury for two or three days in moist earth, covering tops as well as roots. This will fill out shrunken stems and limbs.

In more northern sections—and at

rare intervals in the southern—trees get chilled in the boxes, owing to severe changes of weather en route. If any signs of ice appear in the packing material, bury the trees and packing material in earth, and leave for several days, or until the frost is thoroughly drawn out.

HOW TO PLANT TREES.

The proper way to plant a tree is to first cut off all damaged roots, then shorten top to balance, plant no deeper than tree stood in nursery. To keep borers out, and sun from burning young tree, wrap tree with an old sack, or better, get the boss tree protector, yucca bark; this will only cost you one cent each and can be had at nursery. By following this method one can get a full stand of trees, which is very desirable. Trees should be well watered when planted, then well cultivated after, with very little water. Be sure and not bark or knock off buds with whiffiletree, as this kills more trees than anything else.

THE RUSSIAN THISTLE.

Comparatively small modifications in the structure, habits and environment of a plant are capable of changing it from a harmless dweller by the wayside to a most aggressive enemy of the agriculturist.

The law of evolution holds in the case of weeds as certainly as with flowers and fruit. Nature is producing new varieties of our common garden weeds, which every now and then appear, and temporarily conquer wide territories of cultivated land.

The so-called Russian thistle, or Russian cactus, poetically called by the Russian moujiks "the wind witch," belongs to the class of "tumble-weeds" and furnishes an excellent illustration of these dangerous modifications in plant structure.

Among its relations are several species of Atriplex, shrubby plants of the desert; the pig-weed, Chenopodium; the grease-wood, Sarcobatus; and another rolling weed, Cycloloma atriplicifolia. Botanically, therefore, it belongs with some of the worst weeds known to agriculture.

It is an herbaceous annual, diffusely branching from the base and forming, under favorable conditions, a round, firm head, from one and a half to three feet high and twice as broad. Its growth is extremely rapid and the plant hardens so as to be quite thorny as early as August.

Like the common tumble-weeds of California and the middle west, the season of rolling is in the fall, when the action of the wind causes the root to break at the surface of the ground, and the plant is blown about over many miles of territory and often for many successive weeks.

The seeds are held in place in the axils of the bracts by two minute tufts of coiled hairs, which prevent them from falling all at once. A large, mature plant will sometimes bear from 100,000 to to 200,000 seeds, and the method in which these seeds are borne, as explained above, distributes them over an immense area.

The popular literature of the subject is full of stories which illustrate this point. In one instance a farmer is said to have labeled a Russian thistle and twenty-four hours afterward the plant was discovered sixty miles away!

PEAR BLIGHT.

There are very disquieting rumors regarding the pear blight, some authorities stating that there are doubts about Bartlett pears ever again being grown on a large commercial scale. This we doubt to be a permanent condition, as there will be some solution to the problem. Growers who have suffered so severely will, if they start in again, be more careful and take the disease at the start. The present disaster to the industry will be a warning that will last for all time in California.

Ballooning has a curious effect on the vision. The pressure on the visual organs decreases and the sense of sight becomes so keen that at an altitude of 6000 feet a bottle dropped to a body of water below may be observed in detail as it disappears beneath the surface.

Turn On The Rain When You Need It

IF YOU are a farmer you have seen your crops suffer for lack of moisture.

Did it ever occur to you when the drouth came what a fine thing it would be to have a stream of water running through your field, which could be turned onto the thirsty ground.

If this thought never did occur to you just stop and think a minute—water always there no danger from dry spells—no possibility of crop failure, for when you have good land, good seed and warm weather all you need to make a perfect crop is moisture—we furnish the moisture and there is absolutely no failure in the supply.

You believe in irrigation—you can't help it, for it marks the difference between absolutely sure crops and uncertainty.

Certainty is always to be preferred—therefore you believe in irrigation.

That being the case it only remains for you to choose the best spot under irrigation in which to invest your money and make your home.

All things considered, Sunny Southern Alberta is the best district in the world for the man seeking sure returns.

In the first place, the Canadian irrigation laws are the best on earth—in the history of Canada there has never been a suit over water rights—the Government stands behind the farmer and settles disputes free of cost in case there should be any, but there are none because the Government sees to it that no irrigation ditches are built unless there is ample water to supply them.

To the farmer who has had endless water litigation this means much.

The land is good in Alberta—there is no better and the constant deposit of silt and other suspended matter continually improves it.

Southern Alberta is without question or doubt the finest live stock country on earth—the summers are grand and the winters are mild as those of the Central States.

Almost any crop can be raised in Southern Alberta. It is the coming wheat, alfalfa and sugar beet country of the continent, and the markets for beef, mutton, pork, grains and all other farm products are better than those of the western states.

If you want to verify what we say by seeing Sunny Southern Alberta, we will be glad to make the trip cheap and easy for you send your name and address and learn how to get here the best way and how to get the best land on earth in the LAST GREAT WEST at prices so low that they are hardly to be considered. Address,

U. S. CREAM SEPARATOR

"Has Given Me Perfect Satisfaction"

The Cleanest Skimming Separator.

The chief reason you want a separator is to get more cream—more money— out of your milk. The U. S. gets the most.

Holds World's Record

For Cleanest Skimming

The Simplest Separator.

Both in operating mechanism and bowl construction. Three gears and the bowl are all the "machinery" there is to the U. S.

A "Simple Bowl" Separator.

Only two strong, simple, easily-handled, easy-to-clean parts inside. Gets ALL the cream.

The Most Durable Separator.

Few parts and those strong and finely built of the best materials by skilled workmen.

The Easy Running Separator.

Gearing correctly proportioned, strong but not heavy, accurately fitted, has ball bearings, and runs in oil.

The Safest Separator.

Gearing all enclosed within the solid, low, one-piece, iron frame.

Our handsome free catalogue not only tells, but SHOWS, everything about the construction and operation of the U. S. 27 pictures.

Please ask for No. 20

San Luis Obispo, Cal., Dec. 1, 1906.

It gives me pleasure to say that the U. S. Separator purchased of your agent has given me perfect satisfaction.

It runs easy, skims clean, and I can wash it in 4 or 5 minutes.

I concluded to purchase a U. S. after inspecting several makes of separators including the Sears & Roebuck machine which I would not buy at any price.

H. W. Stalnacker.

The best is cheapest in the end. You get the most for your money when you buy a standard, reliable U. S. Separator. It skims cleanest and wears longer.

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

THE UDDER.

NO MATTER how perfect the form of a cow may be, if the udder is not perfect she is worthless as a dairy animal. The udder is formed of vascular tissue of great delicacy, and heavily chargeu with blood vessels. As the inside of a cow's udder with its wonderfully complicated secreting cells has been recently describeu in this department. I will pass it over. This season of the year, when there are so many cows coming in fresh, always brings with it udder troubles that are not hard to treat if taken promptly at the time, but if neglected result in loss of a quarter or half of the cow's udder.

Fresh Cows.

When the cows are freshening there is great tension in the udder, as the blood vessels become engorged. Nearly all the heifers are likely to come in this month, and will require watching. We nave had them come into milking three months before parturition. If there is milk in the udder it should be drawn. We had one heifer die and two lose the larger portion of their udders from not milking them out As soon as the milk comes draw it out, do not leave it to produce inflammation.

The heifer should be brought up into the corral, fed hay with enough bran to keep the bowels regular, but no green food. At first milk her often enough to prevent caking; if twice a day will do it, then milk twice a day.

If the milk flow persists there is nothing to do but milk her the same as any other cow, but watch, and when there is any slacking up, leave a little milk at one milking and if no bad results show leave a little next time, usually the change of feed will help out and the heifer can be successfully dried off.

Continuous Milking.

Some cows cannot be dried off, and some heifers have the milking quality so strongly bred into them they refuse to go dry, from the time the coming calf has become heavy. These will be the best cows the dairyman has ever owned, but he must handle them well, or they are lost to the herd.

If the milk flow continues in the heifer treat her the same as the rest of the herd. Now if the heifer is not brought up and cared for and milked, the following often occurs: A great swelling forms and hangs as a bag of water under the stomach and the udder takes to swelling. I have seen cases in which the milk veins along the stomach swelled until from the navel to the udder was level and the teats showed as dimples in the mass.

Don'ts.

The natural idea is at once to let out this mass of watery matter from the great sack under the cow. Don't do it! If it is done it will bring on labor and the calf is born too soon, the cow goes down into an attack of mammitis often to lose half or all of her udder. The treatment I have found best is to take the cow off grass and use saline purgatives freely. One pound of Epsom salts with one ounce of ground ginger, a tablespoonful of saltpetre. Give one dose, feed the cow a little grain, rolled barley and bran and good hay. When the bowels become normal repeat the salts, usually about the third day will be right. If the cow is thin, then add a little oil meal to the grain. If the case is acute give her plain, sweet spirits of nitre, a tablespoonful every two hours in hot water to help to reduce the effusion of water.

I am dwelling on this because I have never found it spoken of in any books. The first cases I had, the veterinary lanced the cows, and as I have had other cases reported, it seems to be the usual practice. Every case I have known of this kind failed to be successful, usually the cow lost part of the udder; the calf was always lost.

Prevention.

A preventive policy is always better than having to treat sick animals. In the spring time it will be best to put the cows and heifers that are to freshen shortly in a Bermuda or salt grass pasture and feed them good alfalfa hay. Many heifers directly from the alfalfa fields are too fat at calving-time.

It is well to have them in medium condition rather than in high flesh at this time. I often think the old idea that heifer's calves did not pay to raise came from the heifers being in plethoric condition while carrying their calves, the overfed dam starving the calf by putting the nutriment on her own back instead of laying it up in muscle bone and vitality of the calf.

Exercise.

The secretion of milk in the cow in milking draws away the excess of fats and the calf is nourished on the protein portion of the feeds and is born lean and vigorous.

In mares, it is certain that the dam that works and is in hard, lean condition rather than fat produces stronger colts than the mare that merely runs at pasture. In the palmy days of Palo Alto the high-priced brood mares pulled the gang plows; working at a slow gait being recognized as being good for the coming colts.

Love of Animals.

Every farmer should love animals. I know I love them all, except the pigs. These have never interested me at all, and as I have not been interested I do not know them, so the affection has not been cultivated. The effect of taking care of a cow or two through sickness is that it rouses an affection for them in the heart, their care becomes a pleasure and they are discovered to be interesting as characters. Whenever I read Seton Thompson's tales of the wild animals I think he would find the domestic ones are more interesting if he would study them closely; they are as civilized as we are.

Watching.

All cows that are coming in fresh should be watched; this can be easily done if the cows are put into a small corral and where they are in sight of the house.

If this is done it will save many cows from serious troubles. It is the prompt caring for the animals that are ill that cures them before the troubles become serious.

A cow is hard to treat, as they do not respond quickly to medicine. They give up when in pain. A horse is a more satisfactory patient as he responds quickly to medicine and also seems to take an interest in getting well.

ALL SHEEP.

MARY had a little lamb, its fleece was white as snow; it strayed away one day and went where lambs should never go. And Mary sat her quickly down and tears streamed from her eyes; she never found the lamb because she did not advertise. And Mary had a brother John, who kept a village store; he sat him down and smoked a pipe and watched the open door. And as the people passed along and did not stop to buy, John still sat there and smoked his pipe and blinked his sleepy eye. And so the sheriff closed him out, but still he lingered near, and Mary came to drop with him a sympathetic tear. "How is it, sister, can you tell, why other merchants here sell all their goods so readily and thrive from year to year?" Remembering her own bad luck, the little maid replies: "Those other fellows get there John, because they advertise." —Ex.

SAN JOAQUIN DAIRYING.

Ten years ago the dairy idea in the San Joaquin valley met with general derision and creamery promoters were regarded as wolves, ready to devour the trusting investors in butter factories. The success of all well managed plants throughout the valley has shown this view to have been wrong.

Stock and grain producers have been forced into dairying under compulsion, and many of them are now milking under protest. Where they ought to be increasing the herds and grading up in quality they have a periodical sale of stock, in a vain effort to find an easier way to make a living.

The mainspring of successful dairy farming is enthusiasm for and love of good stock. Without this the business is drudgery, and to escape it every device is figured out that will bring an income, even if the farm is given away piecemeal in its grain crops. It is well understood by almost everyone concerned that dairying can be used to build up the farm, but it is usually done only to the extent of getting actual cash for farm necessities.

This tendency to evade the demands of good dairying is a direct cause of the universal complaint as to farm separator, cream and the slighting of details in its handling prevents the highest returns to the producer.

Cleanliness, the first essential in the care of cream, cannot be looked for on the average farm until enthusiasm for good dairying, love of fine stock and necessity of a better income compels cleanly and careful methods all through the details of handling this most delicate of food products.

The dairies of the valley ought to be placed on the same basis as its creameries in meeting natural difficulties. In our extremely hot season the creamery cannot operate without refrigerator, and the dairies should have an abundant supply of cold well water, and this means motive power for pumping.

Care of cream begins with the milk. Assuming that the barn is reasonably clean and that the milk is run over an aerator, in a protected room while warm and immediately separated, we will follow the cream as it leaves the separator. When well water at its lowest temperature can be forced through the ordinary cream cooler and aerator we will get the best result. The water zig-zags to the upper end, on the inside, and absorbs the heat of the cream, so that it drops into the can at the lowest water temperature

The can should have been cooled and aired, and after it has received the cream neither should be exposed to the warm air again. The can must be closed tight and covered with wet cloths, and be placed where a current of air strikes it. The use of the home cooler is better, with a continuous drip of water from the tank over the cooler; but will heavy sacking around the cans, frequently wet, until carried to the station under cover, good results may be secured.

There is a demand for fine cream at high prices, and it is safe for any dairyman in this valley of railroads and quick transportation to enlarge his herds, buying millstuff and extra feed. The use of milking machines and increase of the milk supply will make the San Joaquin valley a great dairy region. Its river bottoms and irrigation canals will produce a more abundant alfalfa crop, when the farmers go at the business of dairying in an earnest, enthusiastic spirit and plan for the future. The problem is therefore up to our farmers.—Cream Bulletin.

Hand-skimming cannot separate the butter fat from the milk as thoroughly as a separator. The loss would soon pay for a separator. Another advantage is that the calves and pigs may be fed with the milk while it is still warm with animal heat, which is much better than to have it warmed by a fire.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

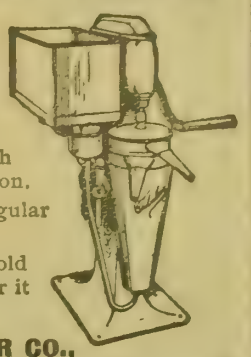
1½ more butter

If you can increase your butter production without any increased cost or any more work won't it pay you to do it? And if you can get more butter from you milk with **less work**, that will be still better, won't it? That's exactly what you can do if you will do as MR. LEITING did—buy a **Sharples Tubular Separator.** Here's what he says about the Tubular:

Randolph, Nebraska, Feb. 15th, 1906.
Gentlemen:—On the 23rd day of January, 1906, I took a No. 4 Sharples Tubular Separator on trial. On learning that I was in the market for a cream separator, the agent for the disc style "bucket bowl" separator brought one to my farm and requested me to give it a trial before making a purchase. After giving both machines a fair trial, I concluded to keep the Tubular as I consider it far superior to the other machine. It skims closer, runs easier, and is very much easier to wash, there being so many less parts. **From three skimmings of milk from 7 cows, we were able to make 1½ lbs. more butter with the Tubular than we could with the "bucket bowl" machine.** B. LEITING.

The Sharples Tubular Separator

MORE BUTTER
MORE MONEY



gets all the cream there is in the milk, does it so easy that it's not work to run it at all, and is so simple, with only one little part in the bowl to wash and keep clean that comparison is out of the question.

The extra cream it gets makes the **Tubular** a regular savings bank for its owner.

All the other good money-making points are told in book F-260, which you ought to read. Write for it today—we'll send it **free** to you.

California Horticulturally

By JOHN ISAAC, Sacramento, California

END OF PLANTING SEASON.

THE setting out of young orchards is now over for the season, and despite the predictions of many growers of an overproduction of fruit, there has been a larger planting of deciduous fruits than ever before. Peaches have led by long odds, and chief of these have been cling varieties. This is largely attributable to the cannery demand. There has been also a heavy planting of apricots, while in the apple sections there has been great activity in the setting out of that fruit. In spite of the poor prices received for prunes for many past years, there has been a very large planting of new prune orchards. This perhaps is partly due to the rapid advance in the price of this fruit during the past season, which has given renewed hope to prune men. In grapes, the greatest activity has been in Flame Tokay and Thompson's Seedless. Both of these grapes are in active demand for the table and the latter is the best raisin grape in the Sacramento valley. Table grape growers have been coining money during the past few years, and the demand for this class of fruit seems to be steadily increasing. The principal table grape section, which is around Lodi and Acampo, has been flooded out during the late heavy storms and it is difficult at the present time to tell what amount of damage has been done, but it is probable that if the water is soon drained off it will not be serious.

FRUIT PROSPECTS.

Reports received from all the deciduous fruit sections of the upper portions of the state are to the effect that the late severe and driving rains have seriously interfered with the prospects for a fruit crop this season. Very many of the trees were in full bloom when the storm came and, as it was continuous for a long time, and accompanied with driving winds, it is feared that much of the pollen has been washed from the blooms and their fecundity destroyed. It is yet too early to state positively what if any damage has been done, and there is still hope that enough bloom will set to insure at least a fair if not a good crop of fresh fruit.

LADY-BIRDS BY THE BUSHEL.

Some of our California lady-birds have the habit of congregating in vast numbers in sheltered and warm locations, and in such places they may be sometimes swept up by the gallon. Some of our wide-awake orchardists, who are fully alive to the value of beneficial insects, and especially of this one genus, which is the most important of all, have made a business of gathering them and introducing them into their orchards where they do most excellent work in reducing the aphids and scale insects. This has been a regular practice in the Pajaro valley apple orchards, where the apple aphis and the wooly aphis are among the greatest pests and it has been found that these little friends of the grower will do much to keep them down and circumvent their ravages. To show in what vast quantities these insects can be procured, it may be stated that W. A. Sanborn, an apple grower near Watsonville, will establish twenty quarts in his orchard, Mrs. E. J. Sanborn ten quarts, and L. V. Willits ten quarts. Forty quarts of lady-birds, a bushel and a quarter. Just think of the number of individuals in that mass, and the quantity of aphids they will need to satisfy their voracious appetites.

BREEDING BENEFICIAL INSECTS IN ORCHARD.

When the internal parasites of the red and purple scale were received by the Commissioner of Horticulture, from China, they were found to be so exceedingly minute that it was impossible to handle them, and out of the question to ship them through the mails, and the question was raised how to best establish them in the sections where they were required for work. To solve the difficulty, it was at last decided to ship the trees on which they had been imported direct to the infested districts of the south and let them breed directly in the orchards and establish themselves in their permanent homes without removal. The first stand has been made in San Diego, and a good start of the parasites has already been established in the orchards of that country in which the red and purple scales are found. Infested trees with parasitized scales will now be taken to other parts, the next point being in Orange county, and by this means it is hoped that the little parasites of these two pests will be successfully established in all infested sections and an end put to the injurious scales.

RAINS DAMAGE CROPS.

The extraordinary wet season which we have had, especially the very severe storms of March, have very greatly reduced the chances for agricultural crops in the northern part of the state. Owing to the early and continuous rainfall a very considerable area of the northern grain section was left unsowed, as it was impossible to get onto the land; of that which was sowed a great deal has been under water during the floods and much of this is drowned out. There is, therefore, every prospect for a short grain crop. Northern farmers have suffered in other ways from the excessive moisture. Many ranches have been drowned out and hundreds of cattle and sheep have perished, while poultry has suffered enormously. It is questionable which is most to be dreaded, a dry season, or one that is too wet.

SEARCH FOR BENEFICIAL INSECTS.

The search for beneficial insects will be continued under the direction of the State Horticultural Commissioner, as heretofore. Governor Gillett has signed the Pyle bill, which appropriated $12,000 for this work for the next two years. The cost of this work to the tax-payers of the state is a bagatelle, and it should be kept up all the time. If we should succeed in securing and establishing not more than one thoroughly effective parasite in five years—and much better than this has been done—the results would amply repay the expenditure.

Lady—"Why in the world are you bringing the milk at 4 o'clock in the afternoon? Can't you get here earlier?"

Milkman—"Earlier? Why, madam, this is to-morrow morning's milk!"

They are best remembered who forget themselves.

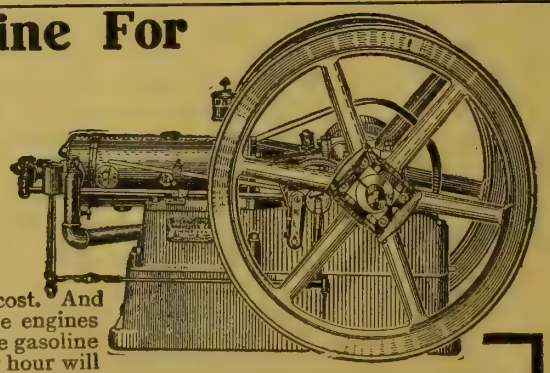
Get an Easily-Operated Engine For

IRRIGATION PUMPING



WHEN you buy an engine for irrigation pumping you don't want to get one that will require an engineer to run. What you want is an engine that will practically run itself for hours at a time. One that is sure and safe and steady, one that is simple in construction, and easily understood and operated.

I. H. C. Gasoline Engines are that kind, and for that reason are especially adapted to pumping for irrigation. A small boy can look after an I. H. C. Engine, and run it as successfully and economically as anyone. Look it over once or twice is all that's necessary in a day's run.

Now, what else do you want in an engine for irrigation pumping?

Economy—To be sure, you want an engine that will pump the largest amount of water at a small cost. And here again I. H. C. gasoline engines fill the bill. Ordinary stove gasoline is the fuel, and the cost per hour will be about 1½c per horse power—about 45c a day for a three-horse power engine working 10 hours. That's cheap enough isn't it? And convenient. You can buy gasoline by the barrel, and always have plenty of fuel on hand.

Durability—Because I. H. C. engines are simple and strong in construction, they are durable, too. There's nothing much about them that can wear out. Repairs are small and inexpensive; parts can always be readily obtained, and you can replace them yourself.

Ease of Operation, Economy, Durability—these are three good points that help give I. H. C. gasoline engines a superiority over others.

If you are now using any other power, or if you are planning to pump for irrigation this year, go to our local agent and examine these famous engines. They are made in various styles (Vertical and Horizontal, Stationary and Portable) and in sizes ranging from 2 to 20-horse power. During the seasons when not in use for pumping they can be made to serve in a hundred other ways.

(INCORPORATED)

WOLVES AND COYOTES.

(Continued from first page.)

usually need not exceed 50 to 75 cents per rod for materials.

Preservation of Skins.

Prime wolf skins in fall and winter, if properly handled, are worth from $4 to $6, and coyotes $2 to $3 each, for robes or rugs. For either purpose the skin should be complete, with feet, ears and nose perfect. The feet should be split through the soles, all bones removed except the terminal segment of each toe, and the skin opened out to dry.

The ears should be partly skinned, the thick base of cartilage removed, and salt forced in between the skin and cartilage. The tail bone should be removed and the tail split along the lower side to the tip. The skin should be nailed up as nearly square as possible, with the legs wide and short, and left to dry in the shade. Many skins are spoiled by drying in the sun or by imperfect skinning.

Museums and taxidermists will often buy wolf skulls at 50 cents each if the bones are uninjured and the brains scooped out and enough of the flesh removed, so they will dry without becoming offensive. For museums they should be labeled for sex, locality and date.

Occasionally wolf bounties are paid on coyotes because county officials cannot distinguish between a large coyote and a small wolf, and in certain localities the distinction is exceedingly difficult. In doubtful cases the Biological Survey will be glad to identify the animals.

SORGHUM SUMMARY.

Though of tropical origin, sorghum is now grown throughout most temperate regions for both fodder and grain.

In 1899 about one and one-third million acres of saccharine sorghum were grown in the United States, or about one-seventieth of the area devoted to corn.

Saccharine sorghum seed is sold under many varietal names, but there are only four leading varieties in extensive cultivation viz.: Amber Orange, Sumac (or Red-top) and Gooseneck. Nearly all the others are forms of Amber and Orange.

In its general requirements sorghum is very similar to corn. It is a strong feeder and therefore will do better than corn on thin soils.

The popular idea that sorghum is "hard on the land" is probably due as much to the poor mechanical condition in which the soil is left as to the removal of plant food by the crop.

Sorghum is more resistant to drouth than corn and is regarded as a better crop for alkali soils.

Sorghum should be sown in a well-prepared seed bed when the ground is thoroughly warm. The time and method of sowing and the quantity per acre will vary with the purpose for which sown. Use plenty of seed.

The largest improved property deal in the history of the orange belt of Tulare county was consummated recently, at which time the Camilla Ranch, just east of Lindsay, was sold to Mr. R. H. Shoemaker of Los Angeles, who has been for several years conducting a shipping industry with offices in that city. The ranch is not only one of the largest orange-grove properties in the State, but one of the best improved. It contains 200 acres, nearly all of which is planted to navels and Valencia trees. The ranch is also equipped with pumping plants, underground cement irrigating plants, extensive buildings, and all other conveniences necessary in conducting the property to the best advantage. Lindsay is making great advances in the citrus industry, in fact, greater advances than any other single shipping point in that portion of the State. Mr. Shoemaker is to be congratulated upon his accession to this valuable piece of property.

Those of our readers in territory around San Francisco will find Smith's Cash Store advertisement in this paper the present week quotes an extra bargain list all along the line of goods handled by that magnificent house. Smith's Cash Store makes a specialty of mail-order rates to families, and their circulars and price list will be mailed to any one upon application. All freight orders are packed and delivered to depots free. See what one dollar will buy, and write them for their catalogue. Mention the Cultivator.

SUCCESSION OF CROPS.

In planning the location of the various crops in the garden, due consideration should be given to the matter of succession in order that the land may be occupied at all times. As a rule it would not be best to have a second plantinng of the same crop follow the first, but some such arrangement as early peas followed by celery, or early cabbage or potatoes followed by late corn or beans, and similar combinations, are more satisfactory. In the south as many as three crops may be grown one after the other on the same land, but at the extreme north, where the season is short, but one crop can be grown, or possibly two by some such combination as early peas followed by turnips.

There is no reason why a mare, if properly hitched and properly driven, should not work right up to the time of foaling; in fact, I have taken the harness off mares to allow them to foal, and have never had a loss by so doing.

A little salt and pepper mixed with the mash is good for the hens.

You Get More Harvest Profits

If Harvest Finds You Ready

TO get all the profits possible out of your harvest this year—that is a plain business proposition with you.

It needs no argument to prove that you can not be sure of all the harvest returns—no matter how favorable the outlook—unless you have made full and effective preparations before hand.

A *quick* harvest—an *easy* harvest free from breakdowns and delays due to inefficient machines—is the harvest that yields every cent of its value to you.

The vital point then is your harvesting machines. You can not afford to take chances on it. A mistake in this matter means loss of golden hours in the field, and profit-eating expenses, to say nothing of the worry.

You can not decide this question wisely when the harvest rush is on. This is one part of your preparation that you can make now, and that it pays to make now.

The test of time is one of the best guides to your selection. And when you think of harvesting machines that have proved their efficiency year after year for a generation, what names are brought at once to mind?

Champion, McCormick, Osborne, Deering, Milwaukee, Plano.

There must be a reason why these six machines have become familiar the world over—wherever harvesting is done.

It means that they have withstood all the tests of *all* conditions of harvest fields *everywhere*.

It means not only that they were built on right principles at the first, but that they have steadily led in improvements from year to year, thus holding the place they have established as the standard.

But world-wide reputation—much as it means—is not the only reason for absolute confidence in this line.

Each machine stands on its present merits, because it is built under the most favorable conditions.

The International Harvester Company is able to demand and obtain the very best materials of every kind, and the highest mechanical skill—everything that goes to make the perfect machine.

To erect and maintain experimental shops and laboratories and to employ the best specialists to work out every principle and detail—these things would not come within the reach of the ordinary manufacturer. But the International Harvester Company can and does concentrate the excellence of all its splendid equipment in these machines.

By owning and operating its own coal and iron mines, its own smelters and steel mills, and its own timber and saw mills, the International Harvester Company is enabled to select the best wood and steel that forests and mines afford.

And in addition it can and does employ the best labor.

With such advantages of increased resources, nothing but the best of material need be accepted. And it is easy to see how machines can be improved in a degree not attainable in any other way—how such rigid tests as these machines are subjected to, can be insisted on—why no machine ever leaves the works until the best qualified experts have pronounced it perfect.

All this care in the selection of materials—all the skill of labor—all the thoroughness of inspection and test—and all the perfection which these things mean and bring about goes into your machine.

Isn't it worth while to consider who gets the benefit in the end—what this concentrated effort on *your* machine would mean to you in the critical time of your harvest?

Isn't it worth your while to consider whether you will not be the gainer in a large degree by preparing for harvest or haying time with a machine that you *know?*

Harvest time is not the time to try something you are not sure of. You want all the guarantee of steady, reliable operation that you can obtain.

Manufacturers can afford to experiment, but you can not.

You want a machine that has been proved by *time*—that has been proved by use under all conditions—that has been proved by your own neighbors—and that is made under conditions that assure you that it is the best within the manufacturing possibilities.

And if repairs ever have to be made, you want to be sure that you can get them at once, and that the parts will fit This is another special advantage of these machines—repairs are always right at hand, for International local agents everywhere have them in stock.

Harvest economy and efficiency not only call for good machines but good twine as well.

International Harvester Company binder twine is made from high-grade pure sisal and manila fibers—the best raw materials that can be procured. The Champion, Deering, McCormick, Milwaukee, Osborne, Plano nd International binder twine is sold in the following grades: Sisal, standard, manila and pure manila.

Call on the International agent and get a catalog, while you have plenty of time to study it. If you don't know an International agent write nearest general agency for the name of the one nearest you.

Valencia Orange Trees
We have a quantity of first-class trees which have not been culled over, at reasonable prices. Also Washington Navel, Loquat Trees, Arbor Vitaes, Spruce, Cypress, Eucalyptus, Acacia, Pepper, Pine, Umbrella Trees, Roses, Palms, Etc.
Write for prices. Address
The Covina Nurseries, 1047 E. 46th St., Los Angeles, Cal.

A Silver Dime
will bring THE FARM QUEEN, a large monthly, for one year. We will also send your name to 100 publishers requesting them to send you a free copy of their paper. Send ten cents today for all the above.
THE FARM QUEEN.
927 Canton St. Baltimore, Md.

SURE CURE FOR PILES
ITCHING Piles produce moisture and cause itching. This form, as well as Blind, Bleeding or Protruding Piles are cured by **Dr. Bosanko's Pile Remedy.** Stops itching and bleeding. Absorbs tumors. 50c a Jar at druggists or sent by mail. Treatise free. Write me about your case. DR. BOSANKO, Philada., Pa.

With the Citrus Growers

By J. W. MILLS

TURNING UNDER GREEN STUFF.

NOW is the limit of time to which the plowing under of green crops can be extended. Early in March is a better time, but the quantity of top that is formed between that time and now makes it a great temptation to withhold the plow.

Peas and Vetch.

Peas will have made an abundant growth by the first of March if planted in September or October.

Not so with the vetch. It makes its best growth in March, but up to that time it is making an abundant root growth. Peas plowed under at this time will be heavy with tough fiber while the vetch is still succulent. Here is where the vetch has the advantage of the pea-vine.

A Roller Useful.

When the plowing has been put off late and rains do not come, or show inclination to follow the work, it is best to go over the plowed land as soon as possible with a roller. This packs the soil and fills the air spaces with dirt and prevents the land from drying out.

This, of course, hurries the decay of the vegetation and fits the soil for proper cultivation for the balance of the summer. This is important, for a great part of the humus forming crop is lost if it is pulled out by the cultivator and allowed to dry on the top of the ground and finally removed.

Degenerate Orchards.

There are a greater number of degenerate orchards in which green crops are coming this year than ever before. There seems to be a feeling that the green crop is part of the correct method of bringing these old orchards out.

Now it often happens that such orchards have had very indifferent care and that the plowing has been so shallow that the larger part of the roots is near the surface and plowing at a depth of six inches will sever a large percentage of them.

The plowing at this time of the year should not be so deep as to destroy a very great many of them, but some of them should be plowed up. There is a general feeling that plowing deep for the first time especially, when the trees are blooming or setting the fruit, will cause heavy crops. This has perhaps been definitely settled, but many growers claim that such has been their experience. On the other hand certain facts go to prove that cutting the roots will have the opposite effect.

Gophers and Frost.

Gophered trees will sometimes set a heavy crop in an apparent endeavor to make a final crop to perpetuate the species. This is a recognized law of nature. However there are always exceptions, and this late cutting of orange roots is, to our mind, not definitely settled. In the meantime we would be inclined to stick to the medium and do the heavy cutting in the fall.

The question of the effect of frost on the trees may come in here, but in lieu of more definite knowledge the latter time seems to us the best. It may be that a certain time must elapse between the time of injury and the time when the plant will succeed in its final effort and produce fruit. There are many things that may enter into the kaleidoscopic workings of nature. There are other things relating to irrigation which seems to point to the fall or early winter as the best time to do deep plowing.

When green-manuring crops are to be grown continually or even interruptedly, it makes no particular difference if all of the green stuff is not turned under deep, so long as it is all finally worked into and incorporated with the soil. The removal of any of it from the grove should be strictly guarded against and for this reason it should be turned under as deeply as possible. There will always be part of it left on top to be worked in some other time.

FLORIDA ORCHARD CULTURE.

Orchard cultivation should, as a general rule, be shallow during the late spring and summer months. In all sections subject to damage from cold it is desirable to turn under the covercrop with a turn plow in the late fall or early winter after this covercrop has died down; the principle involved being that for frost protection purposes a grove should go into winter quarters with the surface of the ground entirely bare of grass and weeds. Care should be taken, however, that the plow does not run too deep. In sections free from frost danger, a cutaway or spading harrow is sometimes preferred. This cutaway or spading harrow can be used also for the first cultivation in the spring—running through the grove at such different angles as to cross and recross its own track. After first thoroughly breaking the soil in the spring, whether with turn plow, cutaway or spading harrow, it is better to follow with a surface-stirring and smoothing harrow. This should be run over the groves or orchards at intervals of one or two weeks until midsummer, the more frequently during extremely dry weather. This frequent, shallow cultivation forms a dust mulch, which serves to retain the moisture in the soil and keeps the ground in good, friable condition.

YOUNG ORANGE TREES.

Do not set trees or plants too deep particularly oranges. One can generally judge about the proper depth for setting the trees by the earth-marks on the trees showing how deep they were in nursery rows. If set at the same depth, this will be about right.

If the weather should become dry and hot after citrus or other evergreen trees are planted, they should be shaded with brush or canvas drawn over stakes on east, south and west sides, to prevent tops drying out and dying back. This is particularly desirable in summer planting.

In watering, remember that one thorough drenching is worth a dozen small applications. This applies to water put on the soil. Tops may be sprinkled very frequently, the oftener the better.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

"Some men," said Uncle Eben, "is like de horn on an automobile. Dey ain't doin' a thing to push things along, but dey sounds like de whole works."

Never allow the foal to follow the mare when working, but keep it in a well-built, roomy box.

The Vegetable Garden

By ERNEST BRAUNTON

GROWING SWEET POTATOES.

THE sweet potato grows readily by cuttings from the growing vine planted out directly in the field if the ground is moist and warm. This method is followed to rapidly multiply a rare variety. The usual method is to plant the crop by using sprouts from potatoes on which growth is quickly started with bottom heat. Any of the hot-bed appliances described in the chapter on propagation may be used for this purpose on a small scale, but in the warmer parts of the state it can be done on a large scale for field planting without expense of glass or cloth covering. If, however, the hot-bed is used, care must be taken against over-heating.

To grow plants in the open air, dig a trench four or five feet wide and about two feet deep; the length according to the number of plants desired. The trench should be dug in light, well-drained soil, in a place protected from cold winds. Put in fresh horse manure and tramp down until about a foot and a half of thickness is secured. Wet it well, but not enough to drain, and immediately cover with three or four inches of moist soil. Upon this place the sweet potatoes just as close as they can be put down without touching each other. When done, sift in fine sand between the potatoes and finally cover with three inches of very sandy loam, or even with sand. Keep this bed moist but not wet. Moisture and heat may be retained by covering the bed with two inches of loose straw to be removed as the shoots appear. The plants are ready for use in about eight weeks from the bedding of the tubers, when they show a few green leaves; they can be detached by pulling and will bring their outfit of small roots with them as they are pulled out of the sand. The tubers will then send up other shoots, which can be planted later.

Some prefer to uncover the potatoes, beginning at one end of the bed, removing the shoots and replacing the covering. This lessens the danger of breaking the shoots. Others split lengthwise and plant with the cut side down so that all the shoots come from the upper surface and are thus less liable to break in pulling.

Most sweet potatoes are grown on ridges to secure greater heat in the soil and to facilitate irrigation, but flat culture is also practiced, and in some regions is decidedly better. After the land is well prepared and harrowed down smooth, mark off the rows three feet apart and set the plants eighteen inches apart in the row. When the ground is thoroughly warmed by the advance of the season, say in April or May, take the shoots as described above. They must, of course, be kept from dying out, the young roots being very tender. In taking them to the field they must, therefore, be kept in a bucket with water, or in a wet sack, the former being the best. Plant out the shoots eighteen inches apart in the rows, one in a place, setting them down in the soil deep enough to find permanent moisture.

Sometimes when the object is to get unusually large potatoes, instead of pulling off and setting out the slips, the potato is lifted out and with every slip a small piece of the potato is cut out and planted with the slip. This method will bring the earliest potatoes, but the number of sets are many less than though the potato be allowed to remain in bed for their continued production. (The above is printed by request and copied from Wickson's Vegetables).

TOMATO CULTURE.

Tomatoes are readily grown from seed and the best plants are those produced with moderate heat. They need protection from cold rather than forcing heat, as our day temperatures from February onward are almost always adequate. For earlier starting of plants some bottom heat is desirable and can be profitably used if care is taken for free admission of air and subsequent hardening of the plants by later growth under protection, but at lower temperatures.

Plant the seed about the middle of February in a small box two inches in depth, and keep in the house by a south window in a moderately warm room. On warm, sunny days put them outdoors, and let them remain out day and night whenever the weather is warm enough; in this way they will make stocky plants and be much hardier than if raised altogether in the house. The soil should be rich and mellow, and always kept a little moist. When the plants appear, thin out to an inch apart. As soon as the plants begin to crowd each other, transplant to another box about four inches in depth and give them a space of four inches. By the time they crowd each other again they can be transplanted outdoors on the south side of the house or barn into a good-sized bed of rich soil. Here they can remain until they get to be large, strong, hardy plants, with very large, fibrous roots. When all danger of frost is over, take a sharp spade and cut out a square of dirt with each plant, put into rows of six feet apart, with the plants the same distance in the row. Plants can be transplanted in this way when over a foot high and in blossom. By transplanting them just at night, or on a cloudy day, they will hardly ever show a wilted leaf. Blights, if they appear, may be controlled by spraying with Bordeaux mixture.

PLAN OF VEGETABLE GARDEN.

It would be difficult to give a plan or specific arrangement for a garden that would suit all demands, and such a plan must be devised by each individual grower. Suggestive arrangements, however, are here presented, with the idea that they can readily be changed to suit local conditions.

Kind of Cultivation to Be Employed.

The first consideration in planning the arrangement of a garden is the kind of cultivation that is to be employed. Where the work is to be done mainly by means of horse tools the arrangements should be such as to give the longest possible rows, and straight outlines should be followed. The garden should be free from paths across the rows, and turning spaces should be provided at the ends. For hand cultivation the arrangement can be quite different, as the garden may be laid off in sections, with transverse walks, and the rows can be much closer for most crops. Horse cultivation is recommended whenever possible, as it very materially lessens the labor and cost of caring for the crops.

LOCATION OF CROPS.

The second matter for consideration is the location of permanent crops, such as asparagus and rhubarb, and if any of the small fruits, such as raspberries, currants and gooseberries are to be planted within the garden inclosure, they should be included with the permanent crops. The area devoted to the hotbed, cold frame and seed bed should be decided upon, but these may be shifted more or less from year to year or located in some convenient place outside of the garden.

When there is any great variation in the composition of the soil in different parts of the garden it will be advisable to take this into consideration when arranging for the location of the various crops. If a part of the land is low and moist, such crops as celery, onions and late cucumbers should be placed there. If part of the soil is high, warm and dry, that is the proper location for early crops and those that need quick, warm soil.

POOR FIDO!

The honeymoon was over, and the husband, returning from business, was grieved to find his little wife crying bitterly.

"Oh, George," she sobbed, "such a dreadful thing has happened. I had made a beautiful pie all myself, and Fido went and ate it!"

"Well, never mind, my dear," he said, cheerfully, "we can easily buy another dog."

Wright's Green Meadow Dairy
Established 1861

AUCTION

300 COWS AND HEIFERS

This is without exception one of the finest Dairy Herds in Southern California. The bulls at head of this herd are **Thoroughbred Registered** and the cows are all selected dairy stock.

200 Cows milking at present time. Many are exceptionally heavy producers—milking 60 pounds and over per day.

Wednesday, April 17, '07
One Mile West of Watts
Three Miles South of Ascot Park

Teams will meet Pacific Electric Cars at Watts Station

TERMS:—Six Months Time on Approved Note
Liberal Discount for Cash

Old-Time Spanish Barbecue, Free

Sale Begins Promptly at 9:30 A. M.

On account of the large amount of stock to be sold, the sale will begin promptly at 9:30 A.M. COME EARLY.
All will be sold without limit or reserve, as owners are retiring from the dairy business.

Reed & Bennett
BRIGGS & WEBER, Auctioneers
555-557 South Los Angeles Street

No Outside Stock Will Be Sold at This Sale

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

THE CULTIVATOR.

Scarcly a day passes that the mail does not bring to this office from one to half a dozen letters, commendatory of the California Cultivator. Some like one department better than another, but all agree in the value of the paper to the agriculturists on the Pacific Coast.

Advertisers, and they do not frequently give praise to publishers, say they get the best returns from the California Cultivator of any weekly periodical in the state of California. So great has been the demand for space in the Cultivator, that for some time the publishers have been compelled to enlarge it from 24 to 32 pages. It has not been deemed good policy to eliminate any reading matter which would be of value to the paper, hence the weekly issue has been enlarged to accommodate the volume of business during the busy months.

Steadily keeping pace with the advertising business has been the subscription growth. The class of subscribers coming to the Cultivator is the very best in the state; the well-to-do class, so called, who do not take a paper for a few months, but if it meets their views, and is helpful, take it for years. They are the intelligent, progressive farmers and horticulturists who are looking for new ideas and helpful suggestions. The Cultivator is practical and helpful, and this accounts for its steady growth in circulation. The time is almost ripe for a regular thirty-two page weekly issue, and when it does come, the Cultivator will be the most valuable weekly publication west of Chicago and Kansas City. It is already the best paying proposition of its class in the West.

This is the season for the farmers of the country to repair the roads adjoining their farms for the summer. In many localities of the country the farmers put this work off until the roads are dried out and then grade them up to a high ridge in the center. This may make fall roads, but, on the same principle, good spring roads may be made, although by a somewhat different method.

THE MILKING MACHINE.

Dairymen have been slow to receive help from inventors. While almost every other branch of farming industry has profited by modern improvements, the dairyman has seen no relief from the toilsome work of milking. Not until the past two years, really, has he been promised assistance along this line, and even that slight promise has had so many backsets that he has well-nigh become discouraged. The indifferent class of milkers he has been able to secure, has provoked him to the verge of despair. Thousands of men have given up dairying altogether, because they could not get competent, honest, clean milkers. But now there has come to the dairyman a substantial relief, and it is found in the up-to-date milking machine.

After talking about it for a great many years, during most of which practically no progress was made at all, the milking machine sems at least to have been developed into a fairly complete success. It is not to be understood that there is no room for improvement still, for there will always be; but it is at least in such practical shape that it is being built and sold and practical men are using it. And the ever-uppermost question in many minds is, "Why was it not done before?" As now made and used the machine is practically a suction machine run by suitable power and capable of having a number of tubes to be attached to different cows, and operated all at one time.

Dairymen have bought these milkers and are using them, and this is pretty good evidence that they are a success, and some real advantages have been found in their use that was not contemplated by many. One of these, and a most important one, is that the milk can be put into tight cans with practically no exposure to the germ-laden air of the stables, and absolutely as pure as when it was in the bag of the cow. Of course that disgusting feature found in the milk from some dairies, dirt settled in the bottom of the vessel the milk has stood in, is eliminated.

There is no doubt that the practical milking machine is a great invention. No farm work seems to be so much objected to by a great number of farm laborers as milking. There has been no well-grounded reason for this feeling, but it has existed and does exist to this day. Why, we cannot understand, for milking is less severe than many other branches of work which the laborer is called to do on the farm. But the majority of hired help object and so the difficulty on that score can be eliminated, if one has enough cows to justify the investment in an outfit. And there is where an important question comes in. Is the milking machine going to knock out the small dairyman? At the present stage it looks very much that way. Hand labor cannot usually compete with machines. If it is, it is because "hand-made" things are better than machine-made. But, if machine-drawn milk is cleaner and better than that extracted from the cow in the old-fashioned way, there will be no hope for the hand-milking dairy.

The only possible way for them to live, the small ones, we mean, is to have the milking machines made in a small way as economically as in a large way. It would seem that this can be done as well with the milking machine as with any other appliance. But, until the time does arrive the solution of the milking problem is going to be difficult for the small dairyman just as it has been in the past. One thing is obvious, even now, and that is, that cleanliness must be the first consideration of every dairyman. Boards of Health, Sanitary Inspectors, and customers generally are going to insist, more than ever before, on clean, pure milk. In the matter of food for the human race, the question of hygiene is going to come to the front more than ever before. In the interest of health, the war on germs is going to be relentless, and cleanliness will be more than ever at a premium.

If President Roosevelt's idea of again using the great rivers of the land to aid the transportation question to final solution, shall obtain, and Congress makes the necessary appropriation of money for the improvement in our inland rivers, grain and stock in the country through which these rivers flow will be transported to market at about one-eighth the present cost.

DOMESTIC SOCIAL STATUS.

The ever perplexing question of domestic service in farm and city home life is calling out discussion among economists with widely different views. A few altruists there are who hold to the opinion that our present deplorable servant girl problem is the result of her mistreatment by her employers. They aver that there has been a steady abasement of hired help by housewives for many years until young women have come to regard the kitchen as a place to be spurned, wholly unfit for a girl of respectable birth or bringing up. These advocates of social equality between the employer and the employee, would make the world believe that all we have to do to revolutionize the present system, as it relates to hired help, to bring about an entire change in affairs, is to elevate the status of the servant in the home.

All this sounds philanthropic and nice, and may abound in unselfishness, but it is theoretical, and has failed in practical attempt in numberless cases which have come under our own observation as well as experience. The fact is that the common run of domestics are actuated solely by a desire to do just as little as they can for their employers. It matters not what kindness or attention may be shown them, they have but one thought, and that is, to hurry through their work, at what ever cost or slight, so they may spend as much time as possible in the pursuit of their own pleasures. Their employers may pay them all the attention they demand, they may even treat them with kindness, in a social way, by taking them in as members of the family, still will these domestic autocrats disregard these amenities and take every advantage to inconvenience their employer on the slightest provocation.

Who is to blame for this feeling in the heart of the domestic? A professor of the University of Nebraska, says: "It is the outgrowth of a diseased sentiment of graft which has become so prevalent in society, among all classes, from railroad president, to kitchen cook." This is the view of a majority of domestic employers today. They are forced to this, or some other conclusion, because of the treatment received at the hands of their servants.

But to be frank in discussing this question, there is no doubt that the servant girl is often slighted and mistreated by her mistress when no cause is apparent for ill treatment. Such conduct, on the part of one employer, has the effect to demoralize a whole neighborhood of servants and to create antagonisms which are unfortunate. There is a proper line of demarkation, however, over which neither employer nor employee ought to step, and it is the line of good breeding and respectful treatment, each regarding the other's rights as sacred. But to be expected to go so far as to take servants in the family on equal terms, where they may gain a knowledge of its affairs, is, in our judgement, not proper, nor conducive to family happiness. We are therefore skeptical of the proposition of elevating the servant girl to the dignity of an "equal in the household."

RECOGNIZED MERIT.

A more deserving tribute to the worth of the American agricultural college could not have been paid by Congress than that which carried in the annual appropriation bill an increase of $25,000 for agricultural instruction work. The members of congress have been slow to recognize the worth of experiment stations, but the valuable results which have come from them have awakened a desire, on the part of the agricultural class, for their enlargement and better equipment. Congress could not have done a more popular thing, nor increased an item in the appropriation bill with more lasting benefit to the country, than the increase which was made in the agricultural budget. The agricultural colleges throughout the country are doing splendid work along all lines of experimental work, and they should not be curtailed in their efforts from lack of finances. The Act of Congress increasing the agricultural appropriation is a well-deserved recognition of the merit of the American agricultural college.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Santa Monica is building a Calfalfa factory, to grind and press alfalfa into bales.

Farmers all over the south are complaining of too rank growtn in hay crops.

Many valuable tracts of land have been lost this winter by the encrochment of the river and stream beds.

Too much rain has prevented thousands of acres from being planted or seeded in the several southern counties.

Around Brawley large quantities of alfalfa have been planted this spring, adding to the already considerable acreage.

There will be over 450 carloads of cabbages in the Olive, Fullerton, La Habra and Whittier cabbage belt this season.

At a recent meeting of the Brawley French Coach Horse Association the members of the company decided to incorporate.

O. J. Stowe of Fillmore has lost about 20 acres of valuable land owing to the river cutting in during these last storms.

Pedro Agoure and Cornelio Echenique have leased the 10,000 acres, recently a part of the Forester estate of San Juan Capistrano, for pasturage.

H. F. Wilcox, of Julian, writes us that on account of 30 inches of rainfall there the ranchers will not be able to plant over half the usual acreage of grain.

A treacherous stream tore through the valuable bean and alfalfa lands of John Donlon, near Oxnard, washing away over one hundred acres in places to a depth of five and six feet.

State veterinarians are preparing to make a big fight throughout Southern California against the Texas fever tick in accordance with the provisions of an act put through the last legislature.

There will be small shipments of cantaloupes from the desert about May 10 this year, last year's date being May 25, while carload shipments will begin by June 1, against June 15 last year.

J. A. Machandar and B. F. Ellis, who have recently bought land at Hemet, have decided to go into the nursery business, and will plant twenty acres to all kinds of trees this spring.

At Santa Ana plans are being made, under the law recently passed by the Legislature, to make a determined fight against the Texas fever tick. Orange county has been placed in charge of Dr. Schofield.

A scale on willow and a near relative of the insect which produces the American lac has been found at San Bernardino. Its name is Tachardia larreae, and to the casual observer, looks much like the black scale and is very compact on the limb.

During the past few weeks the growers of the chile pepper have been planting the seed for the coming season. The rains, while a benefit to most ranch work, have caused a "damping off" of these tiny plants, which is making the chile grower much trouble. In some cases fully one-quarter of the seedbed stock has been lost.

HORTICULTURE.

Good orange orchards, all over this state are in steady and ever-increasing demand for investment.

A twenty-acre orange orchard in Rialto was sold to a Canadian gentleman last week for $13,000.

The Hemet Packing-house shipped three cars of oranges last week, making twelve cars for the season.

The recent cold snap is reported to have played havoc with the cherry blossoms in the Yucaipe valley.

The growers of Tustin are organizing for the purpose of breaking up theft of fruit and general produce.

The deciduous fruit growers of the Ontario section claim that the apricot crop will be light this year, but the peach crop will be good.

A. J. Stowe has 15,000 or 16,000 boxes of oranges in Bardsdale and is unable to get them to the packing-house on account of there being too much water in the Santa Clara river.

Banning has made a healtny growth this season, about 150 acres of new orchards have been planted out. This represents 16,000 trees at least. A number of orders are yet outstanding.

Much citrus fruit is now thoroughly cooled before it is started east by a system of electric fans. This does away with the necessity of icing, which means a saving of $75 per car.

The orchardists of Tustin and vicinity are busy plowing orchards and otherwise cultivating the same. Those who were wise enough to plant vetch for a cover crop have been rewarded with a fine crop to turn in.

Oranges are getting puffy and soft on the trees for want of transportation to market, and unless the unexpected happens, the bringing in of a large supply of cars, very shortly the growers will lose much money.

A. Busierre, a Frenchman, graduate of the National School of Agriculture, France, has decided to locate in Santa Barbara and engage in the propagation of mushrooms for the local market and the markets of Los Angeles and San Francisco.

A new scale infection has just been brought to notice. A bunch of hoarhound was brought in the San Bernardino Horticultural office which is well covered with white scale, Icerya purchasi. Queer tastes these bugs develop sometimes.

Jesse Goodwin of Fullerton is still shipping green peas to Los Angeles. He had in seven acres this season and the crop has averaged over $100 an acre. After the peas are taken off he plants the entire acreage to potatoes. He will have another crop of peas in by April 1.

The shortage of cars for the shipment of oranges, which has been so severely criticised by the growers and shippers of Redlands sections, is proving to be a blessing. The failure to glut the market has served to stimulate prices and to keep them up to holiday point throughout the season.

The apricot crop in the Burbank section will be very light this season. The rain and frosts have killed the bloom. The rain also washed pollen from the blooms, preventing perfect fertilization. The rain and frosts have not hurt the peach crop, and there will doubtless be a large yield.

Northern California

AGRICULTURE.

Tulare is making great preparations for her second annual music festival and flower carnival.

Several of the farmers on the plains east of Suisun are making complaints that their sheep are being stolen from the ranges.

There are a few shearing machines in Shasta or Tehama county, the scarcity of sheep-shearers made the introduction of machinery an absolute necessity.

Out of the 100 head of cattle marooned on a knoll at the Rideout ranch near Nicolaus in Sutter county, but twenty-five head were lost in the flood waters.

Work on the Porterville Creamery is to be commenced immediately, and if good weather prevails the building will be ready for the installation of the machinery by the middle of May.

J. H. Pruden, who is extensively engaged in the Angora goat business near Manton, will shear his flock by machinery this spring, using a gasoline engine to furnish power for operating the patent clippers.

A capitalist from San Jose has written the Chamber of Commerce of Marysville concerning land adaptable for raising sugar cane and thinks that there is good prospects for making a profitable business industry.

A meeting of the Placer County Fair association was held at Newcastle last Thursday and plans were discussed for making the fair a success this fall. Another meeting will be held at Lincoln on April 6th for the same purpose.

Sheep owners who have recently returned from Sierra county state that there will be some warm litigation in the latter county over the collection this season of 5 cents per head imposed by the supervisors on all sheep which are grazed in that county.

Farmers about Hanford report a great growth in the alfalfa fields, and it will not be many weeks before a crop of hay will be cut. Pastures are unusually good for the season, and the hay can be stacked as it will not be needd at this time for feed for stock.

Reports are coming in from the country around Yuba City that many farmers lost stock, principally hogs and sheep, which were caught in the flood. T. L. Smith started for the Buttes with about 1000 head of sheep and lost all but 150. Walter Eager and Eli Davis are reported to have lost considerable sheep.

Frank Parker, a rancher near Nicolaus, lost 106 fine milch cows Mr. Parker saw that the levee had broken and himself and daughter started for Nicolaus to secure help. Before leaving Parker shut his cattle up in the barn and when he returned they were all drowned. His cheese factory was also washed away.

A. B. Crowell, who has recently returned from a visit in Butte, Sutter, Yuba and other counties in that part of the state, reports that there will be very little grain grown in that locality this season, as the season was too wet for putting in many acres, and what was planted has been greatly injured by floods which have come since he was there. Wheat and barley will be scarce this year.

HORTICULTURE.

Many ranchers will yet sow grain for hay, expecting to get short hay of exceptional value.

Wages creek and other streams about Westport were higher last week than ever before known.

T. H. Elliott of the Selma Fruit Company has discovered a process for pealing peaches after they are dried.

A creamery is needed at Ukiah for about $3000 goes out of Ukiah every month for butter and this should go to the farmers.

Almond trees about Corning are heavily loaded this season and indications point to a heavy crop of this popular nut.

All Northern California is getting a spasm of Eucalypt planting; the industry will prove a paying one even on the best agricultural lands.

Interviews with the orchardists of various sections of the Anderson fruit belt show encouraging reports for a good peach crop in Shasta county.

Walter Parr and Walter Shippey are engaged in planting 40 acres of lemons on a tract of land recently acquired by them at Zante, near Porterville.

Selma's seeded prunes will no doubt soon be on the bill-of-fare of the United States Army as government food experts are considering the proposition.

The orchardists about Alta have suffered greatly, many large fruit trees being broken to the stump in each orchard by the unusually heavy fall of snow..

In the Colfax district serious injury to Kelsey and Wickson plums has been caused by heavy frost, the temperature going as low as 27 and 28 degrees in some localities.

H. J. Corcoran, a progressive farmer who has a fine ranch east of Willows on the lower Butte City road, intends planting 30 acres to grapes as soon as the ground is in proper shape.

United States' army officers look with favor on California seeded prunes as a fruit diet because of the healthful properties of this fruit and the saving in weight over the ordinary dried prunes.

James Cull is planting two thousand Thompson's a seedless grapes and has already planted, this year, one thousand Lovell peaches on his ranch near Kerman. Both trees and vines were well Culled.

Contracts are already made for this year's blackberries and the figure shows that a good price is being offered. In the Sebastopol section offers of $45 and $50 per ton are being freely made.

California seeded prunes for army services will be put up at the Selma cannery in six pound tin cans, as in this form they may be kept indefinitely and the convenience in handling is a great feature.

Orchard men are much concerned over the outlook for the apricot crop in the Hollister section. The heavy rain of the past week has washed out the pollen of the budding trees, and the freeze which followed the rain, has aggrevated matters considerably. Estimates of the damage vary, though all agree that the crop has been badly hurt.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

DUCKS.

A FRIEND living near San Francisco writes me, "Do you not regret that the Indian Runner Ducks have not been taken up by the farmers here? I hope that you will continue to put in a good word for them, as you know their worth. My nephew (associate editor of a poultry paper in London) writes me that there is quite a boom on in England for Indian Runners, it may reach this country; you know Americans do love to copy the English, and why should we not? They are a fine race, born fanciers, and great lovers of Nature."

Another letter is before me containing a round dozen questions about ducks in general, and Indian Runners in particular, so I decided to take "ducks" as our topic. Next week I am told we are to talk on "Water, water everywhere and plenty of it to drink!"

Indian Runner Ducks are my favorites of all that I have raised, and I feel that I shall benefit many a farmer by spreading a knowledge of the good qualities of these beautiful and wonderfully productive ducks.

Indian Runners were brought to England by a sea captain, hence the name of "Indian," whilst the "Runners" came from their extreme agility; they run instead of waddling like other ducks. In England their good qualities quickly captivated the thrifty farmers. Individual ducks there have made a record of 225 eggs per annum.

Here in California I had ten ducks which laid 2330 eggs in one year. I think this climate more nearly resembles their native land and their laying is never checked by cold and snow here. In India they were bred for their laying qualities, no attention being paid to color. Their business is to lay eggs and this they do to perfection. English breeders claim that eight-year-old ducks will lay as well as yearlings.

In England and America, breeders of Indian Runners are paying great attention to the color of the feathers, and insist upon the pure fawn and white. These ducks have now been admitted to the American Standard, and the blue bar in the wing, which was admired by the Indians, is here a disqualification, as is also the beautiful claret-colored breast.

The feathering here must be fawn and white. The head has a cap of steel gray or dark fawn with a narrow line of white round it, the neck pure white, long and thin; breast, fawn with white on the stomach; back, fawn; the flight feathers of the wings, white; the shoulders, fawn. When the wings are folded the fawn color of the back and shoulders is in the shape of a heart pressed flat. The cushion of the tail of the male is darker, almost steel gray, the legs and feet are orange. The bill in the young is yellow, but as they mature, the drake's bill becomes spotted with green, whilst the duck's is a solid cucumber green. The bills are wedge-shaped, the eyes hazel and set very high in the head.

The standard weight of the drake is four and a half pounds; duck four pounds, but many greatly exceed these weights.

Whilst the weight of the matured Pekins is more than the Indian Runners, there is more meat in proportion to their weight in the Indian on account of the smallness of the bones, the meat also is of a much finer quality, finely grained and more juicy, and at ten weeks of age their weight is the same as the Pekins.

To show the profit in Indian Runners compared with Pekins, I give here the result of a test made by the Dayton Bros., of Remsenberg, Long Island. They are among the large duck raisers, having both Pekins and Indian Runners:

Egg production—Pekins 112 eggs per year; Indian Runners, 192.

Food production one month per hundred—Pekins, 2250 pounds (about); Runners, 1500 pounds (about).

Time required to reach market size—Pekins, ten weeks; Runners, ten weeks.

Time required to reach maturity—Pekins, six to nine months; Runners, four to five months.

This is from a test continued for over a year by expert duck breeders comparing the two breeds.

Indian Runners have been called the Leghorns of the duck family from their laying so many eggs. The eggs are in quality much like hens' eggs and have not the strong, coarse flavor of other duck eggs. I have cooked dozens of them and we all prefer them to hen eggs.

I gave a setting of eggs to a friend living near Compton some time ago. She had alfalfa and an artesian well, her ducks feasted on tadpoles, little frogs and alfalfa, and she commenced on January first to keep an egg record.

Six Indian Runners laid in five months to June first, six hundred and seventy-two eggs. She had on that date sold $68.75 of eggs and ducklings and had twenty-eight young ducklings, and had then two hens sitting on twenty-two eggs, all of which hatched a few days later.

During the five months they had eaten less than one sack of bran and half a sack of cornmeal. They had coarse sand and crushed oyster shell. She kept them shut in a yard at nights, as they usually lay before breakfast and she wanted to get all their eggs. About nine o'clock she let them out and they went down to the frogs, and only came home at night when they found supper awaiting them, but were often unable to eat it as they had partaken so freely of pollywogs and frogs. She had an ideal place for ducks.

I find that the duck eggs are not as fertile in the fall as in the spring. The ducks rest from laying in Sep

tember and October, commencing again in November. The eggs begin to be fertile by January and from the first week in February almost every egg is fertile. It has been found that one male to every ten females is the most satisfactory number to mate up in this active breed. They are most satisfactory in this climate for they never have roup, lice or mites, or any disease except sunstroke. They all need shade, and in the winter a shed to shelter them from the rain. They are the easiest to keep and to raise of any fowl, and are especially adapted to this climate.

They have never been beaten in any egg-laying contest, except in the last one in Australia, when the Buff Orpington Ducks won by a small margin. The story of that contest given in the "Australian Hen" was quite interesting. It was found that the Indian Runners required less water, and soiled the water less than any other breed, and also they ate one-third less and they laid more eggs than any with the exception of one pen of Orpingtons.

When I regretfully gave up my Indian Runners, I sold them to a friend. She, in response to my request, has sent me the picture of her first prize duck and drake, and in reply to question on feeding she says:

"We find it pays to boil vegetables for the ducks; we have what is called a farmers' boiler, which is heated by a distillate burner. It holds 20 gallons, and that is cooked full of beets, turnips or carrots every day, and divided into two meals for about two hundred ducks. It cheapens the feed and they lay as well as they could on anything.

"We are feeding now with excellent results, to our laying stock, 10 gallons of cooked vegetables, one bushel of fine cut alfalfa, one pail of feed meal, half a pail of bran, half a pail of shorts, and two scoops, or four pounds of beef scraps, half a scoop each of grit and charcoal.

"This is for one meal for about two hundred laying ducks, and is fed twice a day, with about a bushel of some other kind of green food during the day.

"I find my patch of Swiss Chard is a great success, all the fowls like it, and it produces more green food on less ground and with less work than anything I have ever seen. The ducks like it as well or better than any other green food.

"I find my Indian Runners lay one-third to one-half more eggs than my hens and are less trouble to raise and care for. The eggs sell readily in the open market for the same price as hens' eggs, and I know one retailer that sells them for five cents a dozen more than he asks for hens' eggs."

Rations.

I have profited much from your chicken talks in the Cultivator and would now appreciate a little further advice.

I have seventy-five Barred Rock pullets ten months old, in two yards and houses; yards twenty-five feet by 100 feet; houses eight feet by nine feet; three sides light, one side enclosed with burlap.

Early morning I feed a little rolled barley, after breakfast they get all the skim milk they want in earth crocks, and dry mash in hoppers composed of four parts bran, one part corn meal, one part beef scraps, one part oil meal. At noon green feed—vetch or alfalfa—all they want, at night wheat fed in straw.

Clean, fresh water twice a day.

Grit and oyster shell always before them.

They are noly laying twenty and twenty-five eggs a day, which is not enough. Can you suggest a change that would bring more eggs? Do they need salt in dry mash? Do they need beef scraps when they get all the milk they want?

They seem to be perfectly well and are practically free from lice.

Hoping I may see an answer in the Cultivator.—J. A. P., Riverside.

You are feeding a good ration, but for this climate a little "wide" that is a little fattening and I am afraid that the feed is turning to fat instead of eggs, you can discover this by hefting or weighing the pullets. There

DON'T FEED the little chicks anything for the first twenty-four hours. Then feed them dry

West Coast Chick Feed

Bright, pure, clean, made of the finest grains, seed, meat, etc., in just the right proportion to make a full, rightly-balanced ration. They like it, too, and eat it all up clean, for it contains no waste whatever. It keeps them healthy and it will make them feather faster, grow faster and larger than will any other feed. For sale by many dealers. If yours does not keep it, try another, or send to us and we will see that you are supplied.

HUSKINS

WHITE and BUFF Wyandottes

Selected eggs for hatching from special matings, only $2.50 per 15. A. W. HUSKINS, 713 Waterloo St. Los Angeles

would, however, be no harm in your reducing the oil cake; in fact, I would cut it out entirely until moulting time. You see in colder climates like Maine the fowls require the fattening food to keep them warm, whilst here they do not need it. The oil meal is also one of the expensive materials in the food. You can add a tablespoonful of salt to a bucketfull (twelve quarts) of the dry mash. I would also add instead of the oil meal one part of alfalfa meal. The straw should be at least six inches deep for them to scratch out the wheat and they should not have more than two quarts of the wheat for the seventy-five every day. If they have to scratch actively it invigorates the egg-making organs and makes them lay. At this season of the year they should be laying, with the feed and care you are giving them fifty to sixty eggs a day.—Mrs. A. B.

Chicken Queries.

(1.) Would it injure the hatch were the door of the incubator opened more than twice during hatching in taking out the little chicks?

(2.) Is there any danger of the chicks spoiling the other eggs by crawling over them after they are out?

(3.) What can one do to prevent the temperature from running down after dark? We have a fire in adjoining room from where incubator is set, and the room seems warm at all times, still it seems to run down, and we have to watch it very closely.—E. G., City.

(1.) It is considered best not to open the door because the warm, moist air rushes out and the cold air comes in and chills both the newly hatched, wet chicks and also the eggs that are still hatching, so the instructions are not to open the door.

(2.) Yes, they sometimes cover them with the white and soil them.

(3.) Close the ventilators and keep them closed at night if you are having any difficulty in keeping up the heat. Watch them for a time after you close them and be guided by your common sense how tightly to close them.

Nothing Serious.

To R. W., City:—I do not think that the shaking of the head you mention is anything serious. It occurs sometimes when the fowls have lice and it may be a little trick acquired when, as you say, he had lice and he will get over it, or he may still have a few. I have noticed it in some strains of fowls; they seem to inherit this trick without being sick or weakly, still I never like it. If you have Mr. Hoffman's stock you have good birds from prize-winning stock and better still, healthy and vigorous.—Mrs. A. B.

BRAN AND CLOVER FOR HENS.

A mess of finely-cut scalded clover, with bran, will be relished by all classes of poultry, especially if it is fed in a warm condition on a cold day. Bran contains a fair proportion of the phosphates, and for that reason may be used with the ration in order to render it more complete. It is not advisable to feed it in a soft condition if it can be used by sprinkling it on cut clover that has been scalded, although a mess of scalded bran and ground oats early in the morning of a cold winter day, is very invigorating and nourishing.

Four pounds of bran, mixed with one pound of linseed meal and a pound of ground meat, the mess slightly dampened, and fed to the hens once a day, allowing half a pint of the mixture to ten hens, will greatly add to the egg-producing materials. As a food for chicks bran should always be scalded and allowed to stand for an hour or two in order to soften, and it will then give good results, especially if mixed with equal parts of cornmeal. The clover and bran will be found a cheap ration, and should be allowed at least once every day.

SHED NEEDED FOR GEESE.

The housing of geese is a very simple problem. They have a coat of feathers that will keep the cold from injuring their system. The most rudimentary shed opens to the south or east, if it affords shelter against the storm and snow, will do. A heavy layer of straw as bedding, to be renewed whenever it gets wet or dirty affords them a chance to bunch up and keep warm.

The Ornamental Garden

By ERNEST BRAUNTON

THE CAMPHOR TREE.

THE camphor tree is a broad-leaved evergreen, related to the red bay and to sassafras of the United States. In its native habitat it attains a height of 60 to 100 feet, with wide-spreading branches and a trunk 20 to 40 inches in diameter.

Its general habit is similar to that of the basswood. The leaves are broadly lanceolate in form, with acuminate points at both base and apex, of a light green color, smooth and shining above, and whitish, or glaucous, on the under surface.

The camphor tree is native in the coast countries of Eastern Asia from Cochin China nearly to the mouth of the Yang-tsckiang and on the adjacent islands from the southern part of the Japanese Empire, including Formosa and the Ryukyu Islands, to Hainan, off the coast of Cochin China.

Its range also extends into the interior of China as far as the province of Hupeh, about 500 miles from the coast on the Yang-tse-kiang, in latitude 30 degrees north. This area, extending from 10 degrees to 34 degrees north latitude and from 105 degrees to 130 degrees east longitude, is all embraced in the eastern monsoon region, which is remarkable for abundant rains in summer.

The camphor trees growing wild in the native range are usually most abundant on hillsides and in mountain valleys where there is good atmospheric as well as soil drainage. The temperature in the greater part of this region, which is partly within the tropics and partly subtropical, rarely falls below freezing. The tree is an evergreen, changing its leaves generally in April, and therefore the winter temperature is a factor of more importance than would be the case with a deciduous tree.

Notwithstanding the comparatively narrow limits of its natural environment, the camphor tree grows well in cultivation under widely different conditions. It has become abundantly naturalized in Madagascar. It flourishes at Buenos Ayres. It thrives in Egypt, in the Canary Islands, in southeastern France, and in the San Joaquin valley in California, where the summers are hot and dry.

Large trees, at least two hundred years old, are growing in the temple courts at Tokyo, where they are subject to a winter of seventy to eighty nights of frost, with an occasional minimum temperature as low as 12 degrees to 16 F. The most northern localities in the United States, so far as known at this Department, where the camphor tree has been grown successfully out of doors are Charleston and Summerville in South Carolina, Augusta Ga., and Oakland, Cal.

At Charleston, Summerville, and Augusta the trees have withstood a minimum temperature of 15 degrees F., but they have been protected by surrounding trees and buildings. At Mobile, Ala., the trees have grown and fruited in protected situations, while in exposed places they have been repeatedly destroyed by frosts. While the camphor tree will grow on almost any soil that is not too wet, it does best on a well-drained sandy or loamy soil, and it responds remarkably well to the application of fertilizers.

Its growth is comparatively slow on sterile soils, but under favorable conditions it sometimes grows very rapidly. An instance is recorded of a camphor tree in Italy a foot in diameter and 90 feet high, eight years from the seed. Under ordinary conditions, however, such girth is not often attained in less than twenty-five years, and such a height is rarely attained in a century. A tree planted at New Orleans in 1883 is now 40 feet in height with a trunk 18 inches in diameter at the base and 8 feet to the first limbs. Under favorable conditions an average of 30 feet in height, with trunks 6 to 8 inches in diameter at the base, may be expected in trees ten years from the seed.

Many a man loses his heart trying to get ahead.

THE OAKS.

In the way of shade trees for lawns, parks, public grounds or avenues, there is perhaps no other tree so popular or so universally used as Oaks. Their broad spreading heads and sturdy trunks make them especially suitable for these purposes. They are very long-lived, and few other trees have the hardihood to withsand unfavorable locations and weather conditions.

Several kinds are especially suitable for planting on the seashore, as they withstand the salt spray remarkably well. Generally, but erroneosuly, supposed to be very slow growers; they are, on the other hand, of fairly rapid growth, capable of holding their own with many other forest trees. Nearly all of the varieties are exceedingly handsome in their green summer dress, and many of them are brilliant in autumnal coloring. The small trees are easy to make live, but should be well cut back at time of planting.

INSECT POISONS.

Garden insects are a great pest and many and various are the methods employed to get rid of them. We give below three recipes for poisoning these pests. The writer has used, at different times, all three for the destruction of wood lice or "sow bugs" in green-houses.

1. To a pint of cornmeal, add enough brown sugar to sweeten, mix well together and add one tablespoon of Paris green. Moisten a litle with water, just so it will hold together. Place the mixture about in small quantities wherever the bugs may be.

2. Take one pound of Paris green one pound of ordinary flour, one quart of well-slaked lime. Mix well together and diffuse with the powder bellows.

3. Mix Paris green with powdered sugar until the sugar shows a greenish color. Distribute it in the evening (in little pinches) near the hiding places of the sow bugs, and if all is eaten next morning, repeat it until all the sow bugs are destroyed.

PLANT PESTS.

Some plants are much more subject to insects than others, and they are apt to appear on these first, and then spread to the rest; and if not attended to promply, will so destroy the foliage and constitution of the plants that they will be almost a complete failure for the whole season.

Insects are sometimes brought on some old stunted plant that has been somewhat neglected. It may not appear badly infested at first, but the insects multiply and spread to the rest of the plants before the owner is aware of the destruction going on in the garden.

James J. Hill, the railroad king, says that a model farm ought to be established in every agricultural county in the United States. It should not contain more than 30 or 40 acres and the local problems should be worked out there with the help of the state.

20 Pkgs. Seeds Free

As a very special inducement to reduce our big nursery stock of roses, we are giving away 20 packages of assorted vegetable and flower seeds with every order for

10 Rose Plants at $2

These are the celebrated Taylor's California Roses, the most beautiful, flourishing, exquisite roses in America, each order comprising 10 different roses; big flourishing plants, 2 years old; such as the gorgeous, EVERBLOOMING TEA ROSE, the HYBRID TEA ROSE, HYBRID PERPETUAL, CLIMBING TEA and NOISETTE, EVERBLOOMING BOURBON, BENGAL, CHINA and others.

Now's the time to plant your rose garden. Send $2.00 today without fail and receive the seeds free (enough to fill your garden with flowers and vegetables).

Soiling Crops.

Will you please give me a list of what you consider the best crops for soiling purposes?

I have eight acres of adobe soil, which I intended to plant to alfalfa, but the weather has been so wet that I cannot get the ground ready for it; I am keeping a lot of cows and will need all the feed I can grow.

Is sorghum a safe crop to grow for them, I have read that it is poisonous to stock at certain times.

Would millet do well on adobe soil? —J. L., Dos Palos.

I have no personal experience with millet as a crop, therefore cannot answer that part of your questions. I should put in some wheat or oats at once cultivating it in, and pasturing it off. As fast as it was pastured off, I would plant the land to sorghum and sweet corn, putting in, say, two acres of sweet corn. Cut and feed the sweet corn, and as soon as the land is clear, put it also into sorghum. The early Amber Sorghum seems to be the best for soiling. Cut and feed the sweet corn first; by the time the last of the corn is fed the sorghum will be ready to feed.

The sorghum starts very slowly, and does not grow fast until it has become well rooted; this is the reason for planting the sweet corn. The sorghum is drilled into rows three feet apart. It is cut with the mower set high so as not to cut it below the first joint. It may come on faster than the cows can eat it; if so, then make hay of it, cutting it and letting it lay twenty-four hours, then rake and cock it up. Watch it when it heats, open the cock and when cooled, cock again, putting the greenest on the outside of the cock.

Cured in this way it will be leathery and can be handled without losing the leaves. As to poisoning it does happen that once in a great while the young leaves of the sorghum secrete prussic acid, this is deadly. The time may come when it will be frequent enough to make it too great a risk to use. On the continent lima beans that we like so well in the United States develop this same poison. If you can raise Indian corn, I know no reason why you cannot, why do you not build a silo? With a silo full of good silage and a meadow of good alfalfa, the dairyman is king of a cow paradise.—M. E. S.

Australian Trees.

Kindly tell me through the Cultivator if the Brachychiton diversifolia. How should they be treated? To what size do they grow? Are they hardy? Why is it not in Bailey's cyclopedia? Has it another name? What was the Grevillea you recommended one time? A bush form, not the robusta. Do you know who has it for sale?—M. E. S.

Brachychiton is a botanical synonym of Sterculia and under the latter name it is found in Bailey's Cyclo. It will grow in any soil provided the hardpan is not too close to surface, for it is a tap-rooted tree and must also have good drainage. It is somewhat damaged at times by frost, though not often or seriously. It is a cranky tree, entirely satisfactory in some parts and not at all elsewhere. In the central section of the state, Porterville has many on the streets. The Grevillea is Thelemanniana—a fine shrub—do not know who has it, but will endeavor to have some dealer notify you if it can be found.

Sunburn on Walnuts.

Will you please answer in your paper if the English walnut grafted on the California black walnut will sunburn after transplanting from the nursery and oblige.—F. D. A., Lothrop.

Yes, if it is planted where English walnuts sunburn, and the stocks are English walnut clear to the ground. If it is a top graft it will not sunburn. —J. W. M.

Too Speedy.

I would like to ask you a few questions about the dairy business? I am a new beginner.

How many pounds of butter will one hundred pounds of butter-fat yield?

Why does the test go down; in the winter we had 42, now it is 28 same cows, same feed only more green grass; I do the milking myself.—J. M. R., Latin.

The overrun of butter in excess of butter fat varies from 12 to 20 per cent. The average overrun is probably 15 to 16 per cent., or a hundred pounds of butter fat will make from 115 to 116 pounds of butter. When it makes 120, as it used to do, the buttermaker is in danger of being fined for adulterating his butter with water. This is not the irrigation number or I might say it was too heavily irrigated.

I presume you mean cream. The trouble is that the separator is not fed rightly; if you have a cream screw in the machine tighten it up. If not then feed more slowly, the milk is pushed through too fast. By the eye speed in turning and then watching the stream of cream, you can soon see if it is too large, if it is, let less milk into the separator and the cream will run out thicker. I have often in the springtime to see to this, for the men forget the increase in the milk and try to separate in the same time the cream grows thin at once. If the separator has a capacity of 600 pounds of milk an hour this usually seems right for commercial cream that is about 20 per cent. it will take it longer on 40 per cent. cream, so that 450 will be found to be about all it can possibly be made to separate of 45 per cent cream. Many separators will not do this well.—M. E. S.

Take Off Your Hat.

Please send me information what to do when cows keep the milk. We have two fresh cows, sometimes they give the milk and sometimes not. I know it was in the Cultivator, but can't find it any more.—J. I., Phoenix.

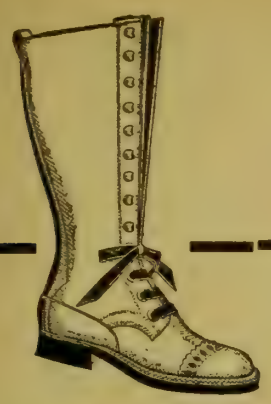
The only thing to do is to be kind and gentle, more careful and give the cows a little feed to divert their attention from the milking. Allow no loud talking around the cows and no dogs. Drive them slowly in from the fields and let them stand around the corral for a short time to quiet down before beginning to milk. It is nervous tension that stops the milk flow and the cows cannot let down their milk at will; they must be soothed. Be patient and pet them; as soon as they trust you as a friend the trouble will cease. I think it was Governor Hoard that said, or perhaps only told the story, that a cow was a lady, and if every man that milked took off his hat to her there would be fewer spoilt ones. A cow is a mother and should be treated with the greatest consideration and kindness at all times.—M. E. S.

Root Knot.

Could you kindly advise me concerning the nature of knot on raspberry root enclosed? I purchased plants of a grower near El Monte, and a great many have these knots, some as large as quails' eggs. Is it a disease, and would fruit trees take it. They are planted in a young orchard.— Country Greenhorn, Murrieta.

The knot which you sent was a small one that is very destructive to Logan and raspberry plants. When they once get these knots, the best thing to do is to dig them out. The vines will fail to mature much fruit it will dry up on the vines before it ripens.

The disease may attack young fruit trees. There is a similar disease that will attack them, as you perhaps know.—J. W. M.



SUITS AND BOOTS

If you are interested in Outing Suits, Headgear, Footwear, Shirts, Leggins or Gloves, send for our new Catalogue. It is printed on heavy book paper, contains numerous colored plates and many fine cuts of clothing and footwear actually in use; and is the handsomest Catalogue of its kind ever issued.. "Business" Brooder
at $7.00

Not a box, but genuine brooder.

The "Business" is built for business, and it does the business every time. Come and see it.

707 So. Spring St., Los Angeles

Incubators.

I am one of the readers of the Cultivator, and would like to ask you several questions on the poultry business, and will look for reply in Cultivator.

First. I have a Cyphers incubator (140-egg) and run it in a small room off our bedroom. Saturday was the 20th day and all ventilators were closed up tight, but it turned out such a hot, sultry day I was afraid chicks would smother so I opened ventilators a tiny bit during hottest part of the day; also opened door of incubator when thermometer went above 104 until it dropped to 103.

Lamp was turned so low that it was next to "out" but I was afraid to turn it out entirely as my various duties called me in and out constantly. Now what should I have done under those circumstances? It gets so hot in Los Angeles you must have had a similar experience.

Second. How do you count the days when you set machine? Say I set it on 20th at 9 o'clock a. m., would you say 20th one, 21st two, 22nd three, etc., or would you wait until completion of the 24 hours before saying one i: e: 21st one, 22nd two, etc.? My hatches have been several days late. This last one (counting 20th as 1st day) made Sunday the 21st day, but they only commenced to hatch last night. Probably my opening door retarded it slightly. Have been using drop-bottom machine and several times when temperature of room went above 75 lowered it to floor and numerous times opened it two or three inches, according to book of directions, but I believe that admits too much air and may account for late hatch. What is your opinion, please? —"Subscriber," Arroyo Grande.

(1.) The reason for the incubator directions ordering the incubator to be kept closed during the hatch, is because as soon as the door is opened the colder air of the room rushes in and the moist warm air of the egg chamber rushes out. The effect of this is to suddenly cool the damp chicks that are just out, and it at the same time chills the still unhatched eggs and retards their hatching, so the makers of the machines say, keep the doors shut during the hatch. When, however, the room is almost as warm as the air in the incubator there is not the same danger and I have often opened the incubator without injury, yet, as you can understand, there is some risk in it.

(2.) I think that your thermometer is incorrect, I think it is registering one-fourth of a degree higher than the temperature really is. One of my Cypher's thermometers did so the second year I had it, and with the same results as you describe. Get your doctor or your druggist to test it. If you set the machine at nine o'clock on the second of April, the first day would be at nine o'clock on the third, and the hatch should be all out the twenty-fourth of April. I surmise that your thermometer is marking too high, because you had a late or a slow hatch, whilst apparently you are taking excellent and intelligent care of it. One thing you do not mention, how your eggs dried out, which is important. The Cypher's Incubators are excellent, but all incubators in this climate have insufficient ventilation, especially in warm weather.—Mrs. A. B.

Too Much Crop.

As I have been a reader of your paper for the past year, and have received many helps from it I, like many other readers, have come to you for help. I have a large Barred Plymouth Rock hen, which has something the matter with her breast; it has got so large that it almost touches the ground, and everything she eats makes it hard as a rock, otherwise, she seems to be perfectly well. She lays every day; would like to know what is her trouble, and I have a White Rock pullet, which lays a double yolk egg every day, is it natural for her, or is it something she eats which causes her to lay double yolk eggs. As she is such a fine, young hen, I wanted to set her eggs, but can't as long as she lays double yolk eggs. Answer through Cultivator. —A. B. C., Laton.

Your hen has what is called a pendulous crop. Her crop, at sometime in her youth, has been over-full probably with mash, this has stretched the muscles of the crop, and it has lost its elasticity. The only cure would be to cut a piece about an inch wide out of the crop and also out of the outer skin and carefully sew them up separately, let the hen fast about two days, and then give her dry grain in small quantities, but if she is not valuable I think you had better eat her.

Some hens are habitual layers of double yolk eggs. I do not know of any cure, but I have known of pullets commencing to lay double yolk eggs and after a time when they have layed out their first clutch, they stopped this habit.—Mrs. A. B.

Lice and Mites.

We are having trouble in getting rid of lice and mites in our flock of White Wyandottes. We are able to keep our houses free of them, therefore the mites remain on the fowls during the day. We tried dipping a few in Creoleum solution—1 part to 100. It kills everything, but leaves the fowl looking dirty.

Can you remember any dip that would be satisfactory? Or any powder that would do the work?—"Redlands."

The mites, sometimes called the little red spider, live and breed in the wood of the hennery, but a few of them will also remain on the hens, they lay their eggs, as small as sand, on the wood not on the hens. You can get rid of them entirely by spraying the houses for three days running with the solution which I have often given in the Cultivator. One gallon boiling water, in which is disolved one pound of soap or soap powder, add one gallon kerosene oil and one pint of crude carbolic acid, churn violently for twenty minutes or only till you are ready to use it. Take one quart of this, add it to nine quarts of water either hot or cool, spray thoroughly. This will disinfect the house if there is any disease among the fowls, and it is an excellent dip to be used just before the moult for ridding the hens of lice and making the feathers drop easily. Of course any dip that you may use will make white fowls look dirty. —Mrs. A. B.

Whitewash for Borers.

Will whitewashing or using "Bordeaux mixture" on the trunks of small fruit trees keep the borers away?

Is it a good plan to prune the top limbs of plum trees after the fruit is ripe, when the trees are growing too tall?—P. R. J., Clovis.

Whitewash will keep the borers out of the trunks of your small trees and is good treatment for your large trees. It will not help the trees, which already have the borers.

We would not advise cutting the tops off of your plum trees till winter, and not then unless the trees are old and need renewing. If they are young, they will have a crop that will bring the limbs down without serious breaking, provided you do not trim them. If you do, when a heavy crop is set, the branches will break above the point of cutting.

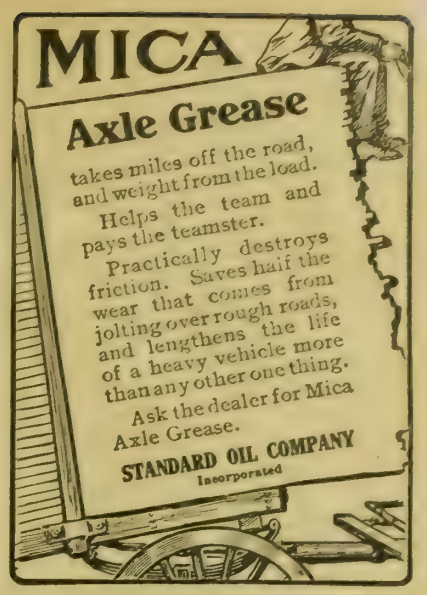
Most varieties of plum trees are improved by cutting back the rampant growth. This is particularly true of Japanese varieties.—J. W. M.

Milking Before Calving.

Would you kindly let me know if, when a cow has to be milked before calving, if she ought to be milked dry each time. Ought she to be milked at regular intervals or only when necessary.—F. W. C., Corralitos.

Only when necessary. I have had cows that it was necessary to milk twice a day. Milk clean each time, but do not strip to the limit. If this milk is not drawn the cow will swell and fill up with water and become very dropsical. I should feed her hay and bran, no grass at all, to lessen the fluids of the body as much as possible. When she has been fresh a week then feed her. This cow will probably be the best you have ever owned.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.



MICA
Axle Grease
takes miles off the road, and weight from the load.
Helps the team and pays the teamster.
Practically destroys friction. Saves half the wear that comes from jolting over rough roads, and lengthens the life of a heavy vehicle more than any other one thing.
Ask the dealer for Mica Axle Grease.

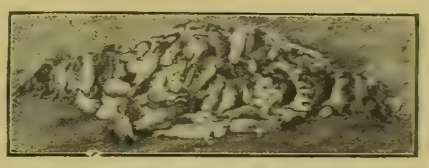
Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us.

We do not send less than 2 bottles.
Compounded under Bille's patent by

Household Department

FOR JUST A LITTLE WHILE.

Now for a little while and for His sake
Let hatred cease, let greed be put away.
Ah, still you talk of profits you may make
And still you have one guestion:
"Will it pay?"

Why not believe for just a little while
That love is more than wealth may ever be?
Oh, why not teach the weeping ones to smile,
And why not help to give the sullen glee?

Now for His sake that in the manger lay
Let all things else be second to good will;
Ah, still you ask one question: "Will it pay?"
And greedily you strive for profit still.

—S. E. Kiser

THE DIVINITY OF POETRY.

POETRY is the record of the best and happiest moments of the happiest and best minds. We are aware of evanescent visitations of thought and feeling, sometimes associated with place or person, sometimes regarding our own mind alone, and always arising unforeseen and departing unbidden, but elevating and delightful beyond all expression; so that, even in the desire and the regret they leave, there cannot but be pleasure, participating as it does in the nature of its object.

It is, as it were, the interpenetration of a diviner nature through our own; but its footsteps are like those of a wind over the sea, which the morning calm erases, and whose traces remain only, as on the wrinkled sand which paves it. These and corresponding conditions of being are experienced principally by those of the most delicate sensibility and the most enlarged imagination; and the state of mind produced by them is at war with every base desire. The enthusiasm of virtue, love, patriotism and friendship, is essentially linked with such emotions; and whilst they last, self appears as what it is, an atom to a universe.

Poets are not only subject to these experiences as spirits of the most refined organization, but they can color all that they combine with the evanescent hues of this ethereal world; a word, a trait in the representation of a scene or passion, will touch the enchanted chord, and reanimate in those who have ever experienced those emotions, the sleeping, the cold, the buried image of the past. Poetry thus makes immortal all that is best and most beautiful in the world; it arrests the vanishing apparitions which haunt the interlunations of life, and veiling them, or in language or in form, sends them forth among mankind, bearing sweet news of kindred joy to those with whom their sisters abide—abide, because there is no portal of expressions from the caverns of the spirit which they inhabit into the universe of things. Poetry redeems from decay the visitations of the divinity in man.—Percy Bysshe Shelley.

A ROOSTER CROW.

I sometimes think I'd rather crow
And be a rooster, than to roost
And be a crow. But I dunno.
A rooster, he can roost, also,
Which don't seem fair when crows can't crow
Which may help some. Still I dunno.

Crows would be glad of one thing though.
Nobody thinks of eating crow
While roosters they are good enough
For anyone, unless they're tough.
There's lots of tough old roosters, though,
And anyway a crow can't crow,
So may be roosters stand some show.
It looks that way. But I dunno.—Ex.

REMEDY FOR CHILD LABOR.

The Secretary of the National Child Labor Committee, Samual McCune Lindsay, clearly outlines the fight for child labor reform in the department conducted by the Committee in the Woman's Home Companion for April. Dr. Lindsay gives this advice to the friends of reform:

"There should be no confusion in the ranks of those who support the Beveridge-Parsons Bill. We submit that no one can read with care the opinion of Justice Harlan representing the majority of the Supreme Court of the United States in the lottery case (188 U. S.) and have any doubt that Congress has the power to prohibit the products of child labor passing from one state into another, nor of the need of the exercise of that power expressly delegated for this purpose to furnish a remedy for the citizens of one state against evils inflicted upon them by another over whose acts they have no other control than through the nationay government.

"All the points that are involved in this controversy are taken up and presentd by able counsel on opposing sides. Every argument advanced against the present Beveridge-Parsons Bill now pending in Congress was advanced with ample citations of cases by the learned counsel in the lottery case. An article made of child labor is an article of commerce. It has a depreciated value the minute it is so labeled, in the estimation of the purchasers.

"The only remedy is that expressly provided for just such a case, in the power delegated to Congress to regulate commerce, which the Supreme Court has already interpreted in the language of the great Chief Justice Marshall as the power to regulate intercourse, and again and again as the power to prohibit, if necessary, the products of one state entering another."

THINGS WORTH KNOWING.

A housekeeper should always think it worth some effort to keep her bed-ticking bright and clean, for ticking is very hard to get clean again when it once becomes dingy or soiled by long usage. Pillow ticking may be kept clean and its pattern prevented from showing through the case if an extra cover is used next to it and a set of these cases made to fit and and buttoned on, costs but little time or material and will last for years.

When the handles of steel knives used in the kitchen become loose or come off, they can easily be mended with resin. Pour a little powdered resin into the handle, then hold the iron rod in the fire until it is red-hot, and thrust it quickly into the handle and when it is cool, the handle will be firmly fixed.

Plenty of hot water and clean towels are the essential requisites for expeditious and thorough dish-washing, and the dishes may be kept shiningly clean by washing them through a warm suds to which a teaspoonful of borax has been added, and every few days the coffee-pot should be boiled out with a strong borax solution, otherwise the grounds will accumulate in the tiny crevices at the bottom. It is equally important to keep the tea-kettle clean—a part of the kitchen outfit which seldom receives all the attention it should.

Enameled sauce-pans soon become discolored, and an easy way of removing the stains is to put a little chloride of lime in a pan, fill it up with cold water and set it on the back of the stove where the water will keep hot,and let it remain for several hours, then scrub with hot suds and it will be perfectly white.—M. H.

Distilled water is far better than the ordinary kind for greasy skin and all others. An ounce of dried rose leaves in half a pint of vinegar left to stand on them for a week then adding rose water is a good remedy. Wash the face with a tablespoonful of this in distilled water and it will prove efficacious on the greasiest skin.

It's not fair to your lamp to dwarf its light with a poor chimney. I manufacture lamp-chimneys that get the most out of lamp-light, and that won't break from heat.

I put MACBETH on every one, because it tells you how to get the best in lamp-chimneys.

My Index tells about these facts, and tells how to get the right size chimney for your lamp. It's free—let me send it to you.

Address, MACBETH, Pittsburgh.

THE MOTHER AND HER GIRLS.

"Do not be unduly disturbed, dear mother, at the dawning of a day almost sure to come in your experience with your girls," advises Mrs. Sangster in Woman's Home Companion for April. "If they have strong characters, if they are able to stand on their own feet, they will reach a station where the train they take may lead them away from you. Girls have said to me, with a shade of sadness, that they regretted that they must sometimes make decisions of which their mothers did not approve. One of the temptations to which we fallible mothers are liable is that of ignoring the obvious fact that grown-up daughters or daughters nearly grown are not babies any longer and are not to be compelled to yield their individuality to ours. There are crises in young lives, and the only thing for a mother to do, having given such counsel as she thinks best, is to leave her daughters entirely free to work out their own problems. Enormous trouble and overwhelming disaster may follow interference in the management of other people's lives, and although daughters are part of your own existence, yet you cannot treat them as if you were an autocrat. Give your daughters room for individual expansion and liberty of choice."

FUN IN THE HOME.

The home should be made the jolliest place on earth for the children. Don't be afraid of a little fun at the family fireside. Don't let the boys think that all mirth and social enjoyment is barred from the home, if you wish to keep them away from places that lead to vice and degradation. Young people must have fun and relaxation somewhere, and if they do not find it in their home, they will seek it at other and less desirable places. Parents should not repress the buoyant spirits of their children, but join in their merriment around the home fireside. The children will lose none of their respect for their father or mother if they occasionally loosen their "dignity" and take part in the children's fun and sport. An evening's romp and play with the young folks will drive dull care away and dispel the memory of many an annoyance of the day. Have fun at home.

TOMATO CREAM SOUP.

To make a delicious tomato cream soup place a cupful of tomatoes over the fire to heat, adding a pinch of soda and a little water. When heated through strain carefully to remove every seed and add to one pint of boiling milk that has been thickened slightly with flour and butter rubbed together until smooth. Boil up once, season with salt and paprika and serve with croutons.

GOOD GINGERBREAD.

One-half cup molasses, 1-4 cup white sugar, 1-4 cup butter, 1 egg, 1-2 cup sweet milk, 1 heaping teaspoon ginger, 1 good cup flour, 1 teaspoon baking powder. Beat butter and sugar to a cream, add molasses, egg, milk and flour. Always put the baking powder and ginger in the flour before sifting. If the milk is on the turn add a pinch of soda in the flour. Bake in moderate oven.

GRAHAM MUFFINS

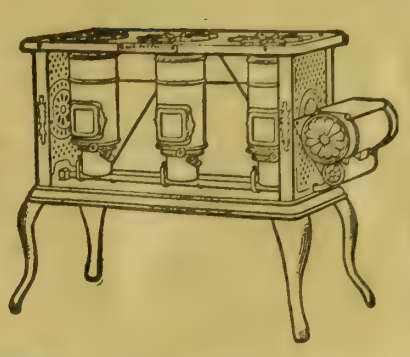
Mix one and one-half cups sifted graham flour, one-half teaspoon salt, two level teaspoons baking powder, and one rounded tablespoon sugar. Stir in one and one-half cups milk, or part water and part milk, and one well-beaten egg. Beat well and bake in hissing hot gem pans twenty minutes.

FRIED PARSNIPS.

Boil until tender and slice them in long, thin slices, dip into a batter made as for pancakes, and fry in hot lard until brown, adding salt and pepper to suit the taste.

"Here come's a man" the green plum cried;
"I wonder what he's after"
"You watch your trunk," the pear replied;
"That fellow is a grafter."

What "Blue Flame" Means



It means the hottest and cleanest flame produced by any stove. This is the flame the New Perfection Oil Stove gives the instant a lighted match is applied—no delay, no trouble, no soot, no dirt. For cooking, the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

is unequaled. It gives quick results because its heat is highly concentrated. Cuts fuel-expense in two. Made in three sizes. Every stove warranted. If not at your dealer's write to our nearest agency.

The Rayo Lamp is the best lamp for all-round household use. Made of brass throughout and beautifully nickeled. Perfectly constructed; absolutely safe; unexcelled in light-giving power; an ornament to any room. Every lamp warranted. If not at your dealer's, write to our nearest agency.

Every Egg Becomes a Chicken

Glendale

Incubators and Brooders

There are a number of good incubators and brooders on the market. There are also many kinds that are almost worthless. The only real proof of an incubator is what it will do under everyday working conditions. It is easy enough for a manufacturer to operate one of his incubators under exceptionally ideal conditions and secure good results. There is one incubator that gives big results without having ideal conditions—

THE GLENDALE INCUBATOR.

This machine is an improvement over any kind hitherto manufactured. It is practically unfailing, regulating temperature and ventilation in a way that is almost wonderful. The large poultry raisers throughout the Coast are installing them. They require less attention. They do not disappoint.

No one should buy any incubator or brooder without investigating the Glendale Incubator and Brooder.

Sold with a positive guarantee of money back if not satisfactory.

The 120-egg size, $22; 240-egg size, $32; 360-egg size, $42; 500-egg size, $52.

We want you to attend a free demonstration now being conducted. If this is not convenient, write for catalogue.

The Produce Markets

Los Angeles Markets

LOS ANGELES, April 10, 1907.

BUTTER

The butter quotation committee of the Los Angeles Produce Exchange lowered the official selling price of butter 5 cents per two-pound roll.

The decline was the direct result of the warmer weather and an increase in the supply, and it is expected by dealers that a further decrease will come shortly, especially if present weather conditions continue to exist. Butter making is just commencing in earnest throughout the valley country, so that unless the San Francisco market continues to hold up to present prices, which does not seem possible, a material increase in supplies should be felt within the near future.

Valley Creamery	52½
Coast, fy,	50
Cooking	20

Cheese

Only 3854 pounds of cheese arrived yesterday, all of which was Anchor. The market is very firm.

Cal. Young American, per lb.	21
California Anchor	20
Cal 3-lb. hand	21
Northern, fresh	19
Domestic Swiss	22
Imported Swiss	30

Eggs and Poultry

The egg market, though receipts yesterday were below the average for this time, denoted signs of weakness at the prevailing prices. No change was made, however, by the egg quotation committee, and none is expected, unless there is possibly a decline of 1 cent.

Eggs, local, per doz	20
Northern Candled	19
Fresh Eastern	18

The following are average prices which dealers pay to producers for live weight:

Hens, per lb.	16
Young Roosters, per lb	18

Old Roosters	8
Turkeys	17
Geese	15@16
Ducks	15@16

Live Stock

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs, 200 lbs.	7.75@8.00
Prime Steers.	5.50
Heifers	4½
alves, per lb	6
Sheep, ewes, per head	5.00@5.25
Lambs, per head	4.00
Wethers	5.50

Potatoes

Potatoes seemed firmer today. There was a good demand for fancy stock and one car sold on the Exchange. Dealers are bidding up more freely for fancy stock now than a week ago, for while receipts show there is a sufficient number of spuds arriving to meet consumption, so large a percentage of these are choice stock or are being sent to other nearby points that dealers will pay a small premium for strictly first-class goods.

San Francisco Markets

SAN FRANCISCO, April 9, 1907.

It looks as if there is to be no shortage of oranges in this market hereafter, now that the railway lines are again in good working order. Since Saturday there have been heavy arrivals, and today ten carloads were reported. The increased supply has not effected prices, as with warm weather there has been a much better demand. Strawberries were received from various sources. There were received from Los Angeles thirty crates of exceptionally fine quality and they sold quickly at $4.50@5.00 per crate, each crate containing 30 small baskets. Fancy red apples were firmer. Other fruits were unchanged, though the warm weather was causing a firmer tendency for choice lemons.

Butter.

"Sure Hatch"

A Wonderful Hatcher

You can almost count your chickens before they hatch, if you use a "Sure Hatch." Our Show Window Hatch was no record breaker, but hatched ***94 strong chicks*** from ***102 fertile eggs.*** R. H. Criffield, St. David, Ariz., reports ***84 strong chicks*** from ***88 eggs,*** and all doing nicely with a Sure Hatch Brooder. We have many other reports equally as good from the 1907 ***"Sure Hatch."*** The "Sure Hatch" Brooders will raise from 85 to 100 per cent. of all strong chicks put into them. No cold corners to produce crowding, but an even temperature over the entire brooder, with plenty fresh air to produce strong, healthy chicks. Don't buy a brooder until you have seen the "Sure Hatch." You want the brooder that will raise the most chicks. See the "Sure Hatch" incubators and brooders in operation at 809 So. Main St. Send for Free Catalogue No. 25.

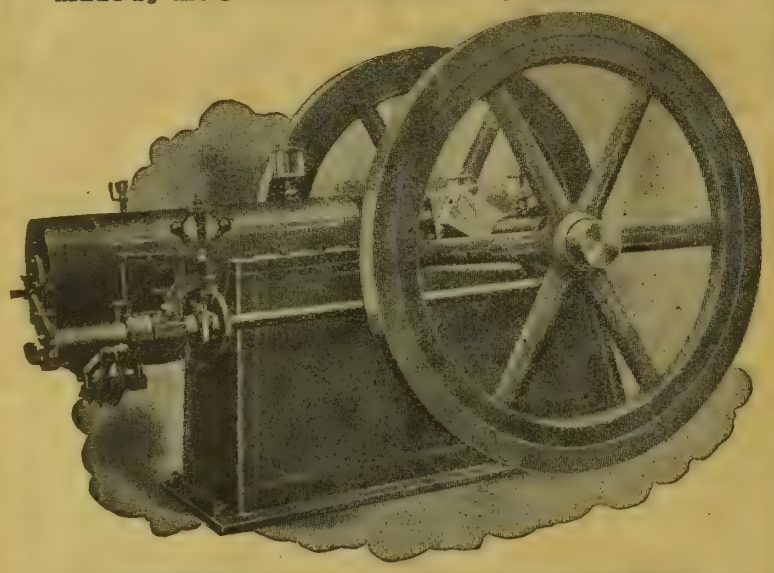
Columbus Engines

Made by the Columbus Machine Co., Columbus, Ohio



Simplicity—Highest Efficiency—Economical
Highest Grade of Material—Best of Workmanship

They have been in the field over fourteen years.

Their output is one of the largest in the United States.

What does this mean? It means that the present standard they are maintaining on Columbus Engines is the result of fourteen years labor of experienced mechanics with one of the best equipped plants in the United States behind them, to produce an engine which is simplicity in itself.

Free from all complicated and trappy devices. It don't take an expert mechanic to see the simplicity and good points on the Columbus Engine over other makes.

It don't take an experienced mechanic to operate it. We carry complete stock at all times. Come in and let us show you.

Estimates given on complete pumping plants.

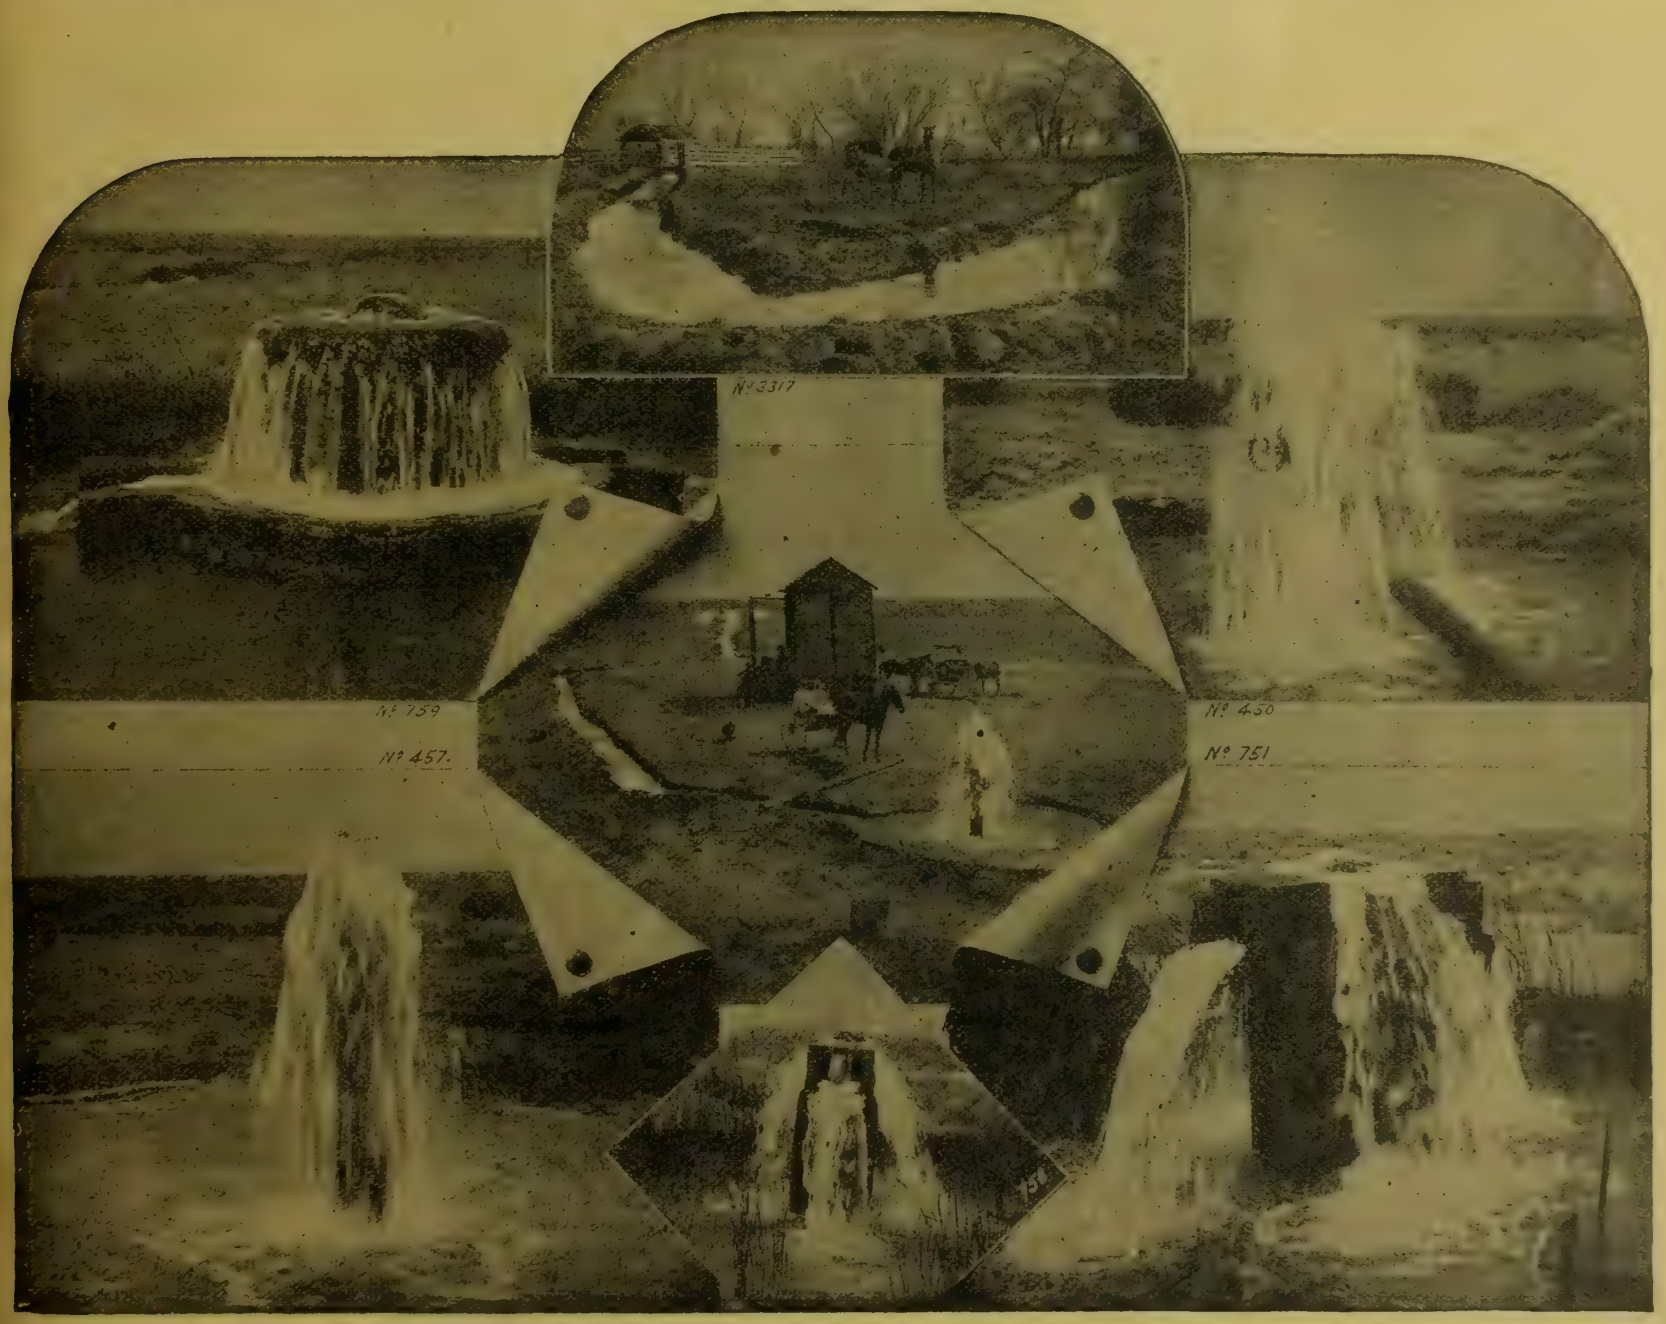
Underground Waters in California



SOME TIME ago considerable interest was excited by publications and public utterances to the effect that the amount of water which can be safely withdrawn from our underground basins is not unlimited, and that in some localities, at least, the limit of safe and conservative development had been reached.

These conclusions were based upon a careful study of conditions in the field, involving the examination of about 11,000 wells of all types, an accurate mapping of artesian areas past and present, and a study of such direct data as then existed upon the fluctuations of ground water levels, under the influence of varying annual rainfall on the one hand, and withdrawals of water by artesian or pumped wells, on the other.

Our ground waters are stored in subterranean reservoirs which are just as definite receptacles as the reservoirs built by man, but are vastly greater in extent. Like the man-made basin, they differ from one another in outline and depth and capacity. Unlike those which are made by engineering skill, we are usually unable to measure directly their dimensions and their capacity. They differ again, from the majority of artificial basins, in that they are filled to the level of the lowest point in their rim by loose sand and gravel and clay, which has been swept into them by the streams which flow to them or across them from the adjacent mountain masses.

Since these great gravel- and sand-filled valleys are merely underground basins, the water in them is subject to the same general laws that govern other reservoirs. If water enters them faster than it is withdrawn, they will overflow; if it is withdrawn from them faster than it enters them, the water level in them will fall. The source of supply is the rainfall, and the sources of drainage are the natural springs, and the wells, pumped and flowing, which supply cities, manufacturing plants and irrigating systems.

Of late, excessive rainfall has given a large supply of gravity water to irrigation systems, and so has greatly reduced the draughts on those auxilliary pumping plants which are used only when gravity waters are insufficient. It has, of course, resulted in a heavy run-off, and has therefore made available an unusually abundant supply of water for absorption by the sands and return to underground reservoirs. Clearly under these conditions our ground waters, if no more is withdrawn from the reservoirs than is required during average years, should show a marked improvement in conditions.

Coulson's Special Dry Chick Food

Feed to Your Chicks

We Sell
COULSON'S SPECIAL
DRY CHICK FEED
THE BEST FEED FOR LITTLE CHICKS AND TURKEYS
COULSON POULTRY & STOCK FOOD CO PETALUMA, CAL.

And See Them Grow

Advantages of Coulson's Ready Mixed Chick Feed

The proper feeding of poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

Chicks should be given a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are best adapted to give nourishment to the growing chicks: Sweet tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other things.

It is clean, sweet feed that is easily digested, and chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks, at a cost of about 4 cents apiece.

Ask your feed dealer about Coulson's special and be sure that he does not sell you something else.

If your dealer does not keep it, write us, and we will tell you where and how to get it.

To be able to raise the chicks that you hatch and have early broilers to SELL AT A HIGH PRICE; to raise NICE LARGE HEALTHY CHICKS; to have chicks that will stand on the floor and crow when six weeks old; to raise chicks that you will be proud of, feed

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00 or 200 lbs. for $7.50, cash with the order.

Pullets Lay Early

"I have fed your Special Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way or raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality." Respectfully, A. P. WARD, Calistoga.

Milwaukee, Ore.

Coulson Poultry & Stock Food Co., Petaluma, Cal.

Gentlemen:—

While in the poultry business I have tried several brands of Chick Foods and find COULSON'S SPECIAL far superior to any other brand.

Yours truly,

(Signed.) Floyd W. Scott.

Relation of Irrigation to Quantity and Quality of Fruits

A Brief Synopsis of a Bulletin on the Subject Written for the Department of Agriculture

By PROF. E. J. WICKSON

IN EARLIER publications the writer has endeavored to prepare useful statements of irrigation policies and methods from the point of view of the irrigator himself, securing the data by careful inquiry from the experience of several hundred irrigators in the Pacific Coast states.

A Thorough Enquiry.

It has seemed fitting to pursue the enquiry along the practical side one point further and draw from experienced irrigators their conclusions as to the effects of irrigation upon the commercial availability and value of fruits. The inquiry had the further object of securing practical suggestions for the assistance of beginners. Questions were sent to about 300 growers of irrigated fruits in the states of Idaho, Washington, Oregon and California and to a number of shippers, driers and canners who had used irrigated fruits in their trade or manufacture. The response from all the above-indicated interests was very satisfactory; a very free expression of belief and a very ample citation of experience were secured.

Quantity as Affected by Irrigation.

This is a matter which is really not in controversy in its general features, for there is a general disposition to credit irrigation with greatness of product; in fact this concession is often made with the view of denying its desirability—a question which will be discussed later.

There is, however, a question newly broached and now commanding much attention, viz., how far is irrigation desirable in regions of considerable rainfall, or, in other words, how much water can a fruit tree or vine use to the profit of its owner?

It is more clearly appearing each year, as Pacific Coast trees become older, larger, and with greater bearing capacity, that more water is desirable than earlier in the life of the plant and that in the same locality some water in addition to an average rainfall, and much water in addition to an occasionally scant rainfall, make for the strength and capacity of the tree, which are manifested in the aggregate weight of the product.

The recognition of this fact is carrying irrigation practice each year farther into the regions where the heaviest rainfall is received, which, on the annual rainfall figures alone, are called humid. Really, the districts in which the advantages of irrigation are now most warmly discussed are the districts where a few years ago freedom from irrigation was gloried in, and in such districts the most striking instances of the commercial benefits of irrigation are to be found.

The old contrast between the desert and the irrigated garden remains, of course, but it is accepted and admired in silence. The contrast which awakens most interest is that between the product of irrigation and that of rainfall where the latter was formerly held to yield all the water that could be desired. It requires a few more years of experience to multiply instances along this line, but they will be found ere long in great numbers in western Washington and Oregon and in northern California.

Irrigation Always Desirable.

It is very significant that there is such unanimity in favor of irrigation, although many of the growers are situated in districts having considerable rainfall.

Irrigation by Checks

It is notable that, in fact, no reports denying the efficiency of irrigation in increasing the product of trees and vines were received, although there are, manifestly, conditions under which irrigation is not essential to the fullest service of the fruiting plants and therefore hardly worth providing.

Correspondents, however, did not consider this point worth making in their reports. This clearly indicates a change in the public mind with respect to irrigation in fruit growing and betokens full recognition of its importance. A few years ago objections to irrigation as either unnecessary or undesirable, or both, would have been urged by scores of correspondents when offered such an opportunity as this enquiry placed before them.

Regularity of Bearing.

This subject has only recently risen to its proper place in the discussion of fruit-growing policies on the Pacific Coast. The declaration of the principle on which regular production rests that the fruiting plant requires moisture for two distinct functions during its active season is not new, but the appreciation of its truth and practical bearings is recent.

It has been forced upon the attention by investigations at the Wisconsin Experiment Station, showing that the tree, in certain cases at least, was devoting energy to the development of the fruit buds for the following year and carrying the burden of the current crop at the same time. It was known that the tree forms fruit buds in the later months of growth after its fruit may have matured, but the announcement of the earlier undertaking of this function strongly emphasizes the necessity of ample moisture supply, not alone for the current crop but for the succeeding crop.

For this reason an effort was made in this enquiry to secure facts from wide observation as to the relation of irrigation to regularity of bearing. Formerly recourse was had to pruning to lessen amount of bearing wood and reduce the burden of the tree after the fruit had set. The newer idea is to supply water to enable the tree to carry more fruit to satisfactory size and at the same time to prepare for the following year. In fact the relation of adequate moisture to the strength and effectiveness of the fruit bud has come to be widely appreciated.

Irrigation Promotes Regularity.

The reports present a vast preponderance of observation and experience that irrigation does promote regular annual fruit bearing.

There are a few instances in which the opposite view is expressed and others in which the observer is in doubt.

In some cases probably the opposing observation rests on experience in situations where trees are not helped in regularity of bearing by irrigation because they really have a greater amount of available moisture, though the rainfall may not be greater than is available on adjacent places where the contrary observation is made. This is strikingly true in the case of Whittier, Los Angeles County, Cal., where Mr. Bequette reports regular bearing without irrigation.

Whittier is a low-lying region with great depth of soil and ground water within reach of deep-rooting trees. In such a situation irrigation is naturally less likely to be profitable, because the trees are supplied by the underground movement of water and enjoy more than their share of the scant rainfall of the district. There may be similar conditions to explain the conclusions of the few others who hold a negative view.

Qualities and Commercial Characters.

The desirability of irrigated fruits, for qualities

Deciduous Fruit Culture

By J. W. MILLS

ORCHARD IRRIGATION.

IT WAS not until recent years that the deciduous fruit growers of the northern and central parts of the state discovered the importance of employing irrigation to make a better grade of fruit. Sections that were producing immense quantities of fine fruit could have improved their product by irrigation, but they were doing well enough. They thought that irrigation would lower the quality of the fruit. This idea perhaps grew out of the results obtained by those who had tried irrigation without giving the subject proper thought and attention. It was found that irrigated fruit was soft and with poor flavor.

Ignorant on Irrigation.

The trouble was, irrigation was done at the wrong time. Nevertheless, this objection staid with the subject for many years, and it is still counted against irrigation by some growers. At the same time, fruit grown in damp soil, near the rivers, brings the most money and has the finest quality. The difference is, in the first case, the task is engineered by a man, and in some cases is irregularly done.

In the latter case nature did the work regularly and evenly. Peach orchards in such situations in the Sacramento valley have in recent years brought over $1000 per acre yearly. This is under natural irrigation. Artificial irrigation on good soil can be made to nearly, if not actually, equal it. The point to keep in mind is, that a tree will do its best when supplied with a certain amount of water. This is a fact beyond dispute.

Irrigate Right.

It does make a certain amount of difference whether the trees gets it naturally or artificially, but the water can be supplied the latter way so as to nearly imitate the natural supply. It should make little difference if it is so done, and such is a fact. This is a lengthy argument to present simple facts, but there has always been more or less argument against irrigating deciduous fruits.

The application of water in furrows is the best method for most, if not all, such fruits. The roots of this class of fruit trees run deeper than those of citrus trees and consequently they will not need irrigation so often, but they will require a longer run of water to give the best results.

When to Irrigate.

Deciduous fruits that are irrigated near to the time of ripening are apt to be too watery and of poor flavor. It is this feature that has brought objections to irrigation. This feature will always have to be settled by the individual grower, as soils differ so that no set rule can be given. Men who have given attention to the details of this part of fruit growing claim that with irrigation they improve the quality and increase the quantity.

The general rule to follow is to keep the soil well-saturated with moisture while the fruit is maturing and making size, but before the sugar forming or ripening period commences withhold the water, or stop irrigation long enough before this period, to allow the surplus water to become exhausted. This is what takes place in the river-bottom soils that are naturally subirrigated.

As the season advances, the water table lowers and through the absorption of the water by the roots and by evaporation, the amount of water in the soil gradually becomes less. With this comes the uniformity of conditions that produce even and harmonious results that tell so strikingly on all kinds of vegetation; fruit trees, and orange trees especially.

Irrigating Walnuts.

Walnut trees require a great deal of water, and while their roots penetrate deeply and wide, the furrow system of irrigation is seldom employed. Here the land is usually heavy and close in texture, and well shaded in old groves.

This prevents rapid evaporation, but still, more is lost than would be by the furrow system. It is important not to injure the roots of walnut trees and for this reason flooding has an advantage.

Irrigation on the Desert.

Irrigation in the Imperial country is wholly by the flooding system, except in the case of vineyards or orchards. Here the furrow system is the most desirable on account of the convenience and small amount of labor.

Melons, of course, cannot be flooded, but all grain crops are, as is the land before preparation. The presence of alkali, the level land and the cheapness of water favor the flooding plan. Cantaloupes are often irrigated from both ends of the furrows; the land being practically level admits of this practice.

Flooding several times before planting field crops, and especially alfalfa, is the only practical way of handling land under conditions there existing. Preparing land with the furrow system brings the salts to the surface along the banks, and increases the quantity at the surface. Frequent irrigations before planting, with cultivation as soon after turning the water off as possible, drives the salt down, and when the crops cover the surface, followed by irrigation, evaporation is reduced materially and the salts remain distributed at lower depths.

IRRIGATION VALUE UNQUESTIONED.

There is one thing we must keep more prominently in mind; that is, that successful, practical irrigation is not so easy a thing to learn and practice as many suppose. The blundering unsuccess of untrained beginners does more to retard the progress of irrigation in new districts than all things else.

I visited a semi-arid section in Nebraska where a few years before a much-needed irrigation plant and plenty of cheap water had been secured. It had proved so unsatisfactory as to discourage not only those immediately interested but the whole region as to the practicability of successful irrigation. I found the condition easily explained by the utter carelessness of application and management of water, while with practical direction it might have been made of vast benefit locally and a useful object lesson for the whole region.

I fully understand that irrigation of deciduous fruits may be mismanaged or overdone, as with citrus fruits, but I cannot understand at this late day how there can be any question as to the great value of irrigation intelligently applied to deciduous fruits, both as to quality and quantity of product. —J. H. Reed.

Trees can be drowned by too much water or may die from too little of it.

DECIDUOUS ORCHARDS.

Since it is important that trees be properly irrigated from the first, it will be well to begin the discussion of orchard irrigation with the setting of the trees. During the first year, all varieties of fruit trees, whether deciduous or citrus, need to be treated in about the same manner.

Before the trees are set, furrows are run near the lines of the tree rows for the early irrigations. Usually water is run through the furrows before the trees are set, and as soon thereafter as practicable. The furrows should be cultivated up within a month, and fresh ones made for each subsequent irrigation. The young orchard should be irrigated only along the tree rows and the soil should be kept moist to a depth of several feet. This will induce the trees to send their roots down deeply, instead of out laterally near the surface. Deep irrigation followed by deep cultivation will prevent the growth of roots near the surface. Since much depends upon the treatment of the orchard during its early growth, it pays to give the trees special attention the first season.

As the trees get older they will need less frequent irrigation during the growing period, and more of the water may be applied during winter. After they are four or five years old at least three-fourths of the water needed may be applied to deciduous trees during January, February and March. The remainder needed may be applied when water is most abundant during summer. The furrows do not need to be cultivated up after each winter irrigation; but they should be renewed as often as once a month, if a green manuring crop is not grown in the orchard. Such a crop is an excellent check to the flow of the irrigating water, as well as a benefit otherwise. When the winter irrigation is finished, the soil should be thoroughly cultivated to a depth of eight to twelve inches, and the surface be permitted to remain dry until the time of the summer rains.

IRRIGATED FRUITS AT FAIRS.

The pomological fairs within the irrigated regions and the great expositions at home and abroad during the last quarter of a century have afforded an opportunity for contrasting displays of irrigated and non-irrigated fruits.

Irrigated fruit is conceded to be rich in show features. Its size and beauty have always commanded admiration, and its superior attractiveness has been sufficiently demonstrated by the fact that in earlier expositions in California, and possibly elsewhere also, it was often set apart in a class by itself, so that the competition of non-irrigated fruit with it for the same awards might be avoided.

A question was, however, addressed to growers as to their experience with irrigated and non-irrigated fruits at the fairs, in the hope that some instructive contrasts might be brought to light. The answers received do not, however, attain such ends, although they do constitute an interesting record of experience, and in some cases shed a unique light on the durability of irrigated fruits in long shipment and during the trying exposure on the show plates.

There has perhaps been no clearer demonstration of these facts than the award at the Paris Exposition of 1900 to the apples grown with irrigation in Idaho. The same behavior of irrigated fruits has been manifested at all American expositions since the Centennial at Philadelphia in 1876, which was the first great opportunity for the irrigated fruits from California.

IRRIGATED GRAPES.

The first season after setting, grape vines need frequent irrigation throughout the season, to enable them to become well established. Two irrigations a month will be beneficial in porous soils, and one irrigation per month should be given in most other soils. The second season, the vines will do well with less frequent irrigation.

During later years, the greater part of the water needed to produce a crop may be applied during the winter. Water to the depth of two feet may be applied to advantage in most soils during this period. When the blossoms begin to open, water should be withheld until the young fruit is about the size of peas. One or two thorough summer irrigations will be ample to produce a good crop. The total amount needed during the year is not over three feet.

IRRIGATION POINTERS.

Too much water on or near the surface will injure fruit trees. Some orchards where water is plentiful are being ruined by too much of it, even in the mountains where natural drainage is usually all that could be desired. The trees are sickly and the fruit of little value.

The things to know are when to irrigate and how much. Just enough at the right time insures the best possible result, but some growers seem to be unable to learn this.

Where hardpan is near the surface, care must be taken or the tree or vine is very likely to be injured if much water is applied in warm weather.

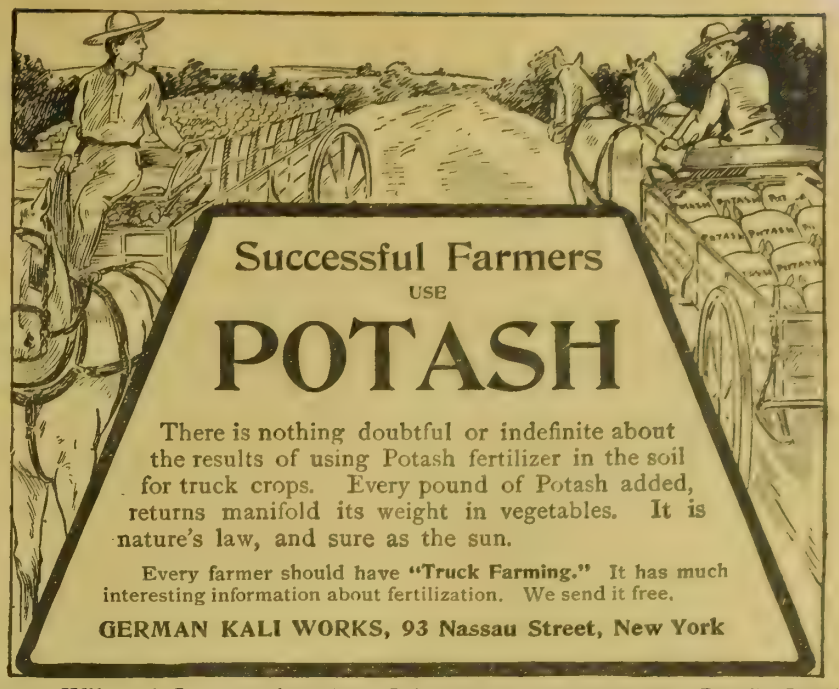
If too much water is used the fruit will drop and the trees show a sickly appearance in the middle of the spring. Moderate irrigation will not do this.

Where water is allowed to stand or there is insufficient drainage the leaves turn yellow, and if the trees are not looked to they are apt to die.

Deciduous fruit trees are injured by too much water and by allowing it to run around the body of the tree.

Fruit trees are often injured by too much irrigation—in fact, many are killed by it. It also spoils the fruit.

Too much water remaining too long around the stems of low-set orange trees causes root rot or gum disease.



Successful Farmers
USE
POTASH

There is nothing doubtful or indefinite about the results of using Potash fertilizer in the soil for truck crops. Every pound of Potash added, returns manifold its weight in vegetables. It is nature's law, and sure as the sun.

Every farmer should have "Truck Farming." It has much interesting information about fertilization. We send it free.

With the Citrus Growers

By J. W. MILLS

CITRUS IRRIGATION.

WITH the beginning of citrus culture in Southern California, began irrigation of orchards on a commercial scale and an attempt at scientific methods. The configuration of the land necessitated different methods of applying water, but the old method of flooding in checks was practiced whenever it was possible.

The Check System.

This manner of applying water was considered the best, for it had the appearance of doing good work, and it did when the soil was new and had never been irrigated before.

The orchard was laid off into blocks with a tree in the center of each, every tier of these blocks being connected with a furrow running from the upper to the lower end. A big head of water was turned on, filling the lowest square first and then turned into the one above, and so on till the whole string was filled to the tops of the ridges on the lower sides. This was repeated on each tier of plots till the whole orchard was flooded.

It will be seen that this method entails a great deal of labor in ridging up the blocks and working them down again after the land had dried out. There were always other undesirable features, the chief one being the great loss of water by evaporation while the land was drying out sufficiently to be cultivated.

Another serious objection was the irregular drying out due to varying porosity of the soil. Sandy spots in the soil would take the water faster than those with considerable clay, and as a consequence the former would be too dry before the latter was fit to cultivate. Nevertheless, the flooding system, while it has disappeared for good from most districts, is the most desirable in those orchards where the soil is a loose gravel and sand.

When the water is run in a furrow over such land, the water goes straight down and does very little side percolation. Furrow irrigation leaves a large amount of surface and lower soil, that contains feeding roots, absolutely dry. The flooding system covers the whole surface and is ready for cultivation almost immediately after the water is turned off.

Orchards which are mostly heavy soil, but with sandy or gravelly spots, or streaks in them, can be most economically irrigated with the furrows in the main part and blocks in the sandy places. It will require extra work to prepare the land, but it is a fact that the poor spots in a grove are usually where the soil is gravelly, but the main reason why the trees are smaller in such places, is that they do not get the irrigation properly. Such places, if they had a flooding between regular irrigations would be greatly improved. This could in many cases be easily done and the furrow system adhered to at the time of regular irrigations.
